

Model Management

The case of Xtend

Mathieu Acher

Maître de Conférences

mathieu.acher@irisa.fr

Material

<https://github.com/FAMILIAR-project/HackOurLanguages-SIF>

Quizz Time

Write a Xtext grammar so that the specification below is conformant

```
foo1.videogen ✘

mandatory videoseq v1 "https://www.youtube.com/watch?v=PJNi1uYhV5w"
optional videoseq v2 "v2folder/v2.mp4"
@alternatives v3 {
    videoseq v31 "v3/seq1.mp4"
    videoseq v32 "v3/seq1.mp4"
    videoseq v33 "v3/seq1.mp4"
}

@alternatives v4 {
    videoseq v41 "v4/seq1.mp4"
    videoseq v42 "v4/seq1.mp4"
}
mandatory videoseq v5 "https://www.youtube.com/watch?v=ezKx-S0LiNQ"
```

Quizz Time (2)

Write a Xtext grammar so that the specification below is conformant; **what is the metamodel generated by Xtext?**

```
foo1.videogen ✘

mandatory videoseq v1 "https://www.youtube.com/watch?v=PJNi1uYhV5w"
optional videoseq v2 "v2folder/v2.mp4"
@alternatives v3 {
    videoseq v31 "v3/seq1.mp4"
    videoseq v32 "v3/seq1.mp4"
    videoseq v33 "v3/seq1.mp4"
}

@alternatives v4 {
    videoseq v41 "v4/seq1.mp4"
    videoseq v42 "v4/seq1.mp4"
}
mandatory videoseq v5 "https://www.youtube.com/watch?v=ezKx-S0LiNQ"
```

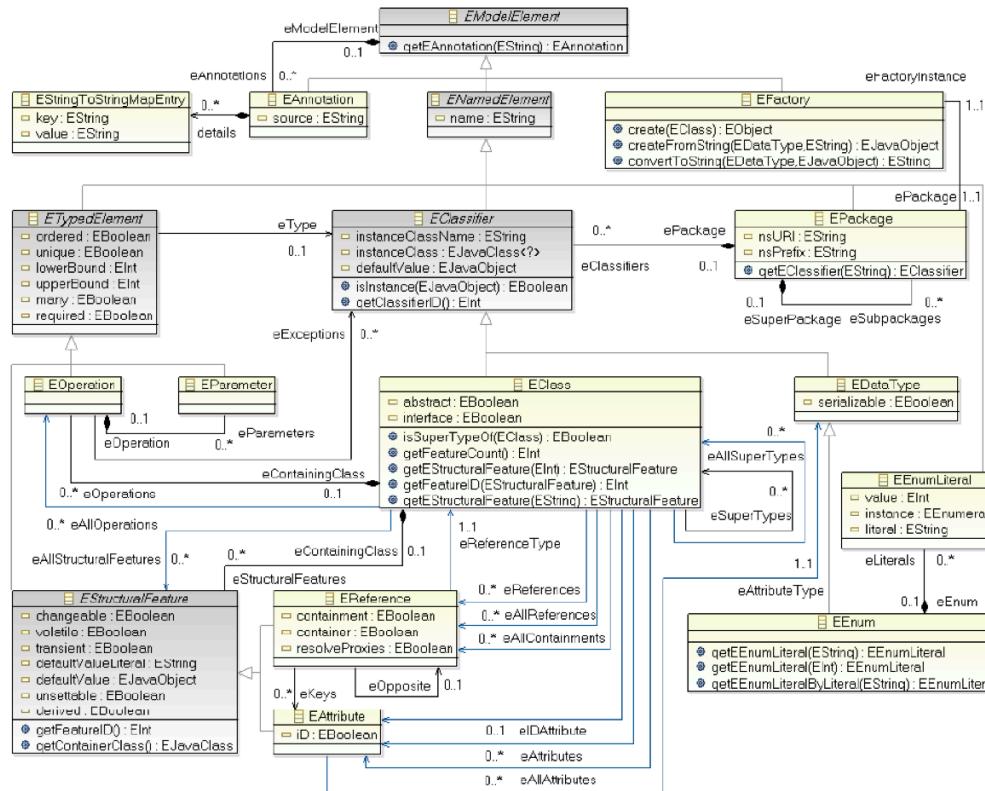

Quizz Time (3)

Write a Xtext grammar so that the specification below is conformant; what is the metamodel MM generated by Xtext?; **use the notation of object diagram for encoding the specification below as a model conformant to MM**

```
foo1.videogen ✎
mandatory videoseq v1 "https://www.youtube.com/watch?v=PJNi1uYhV5w"
optional videoseq v2 "v2folder/v2.mp4"
@alternatives v3 {
    videoseq v31 "v3/seq1.mp4"
    videoseq v32 "v3/seq1.mp4"
    videoseq v33 "v3/seq1.mp4"
}
@alternatives v4 {
    videoseq v41 "v4/seq1.mp4"
    videoseq v42 "v4/seq1.mp4"
}
mandatory videoseq v5 "https://www.youtube.com/watch?v=ezKx-S0LiNQ"
```

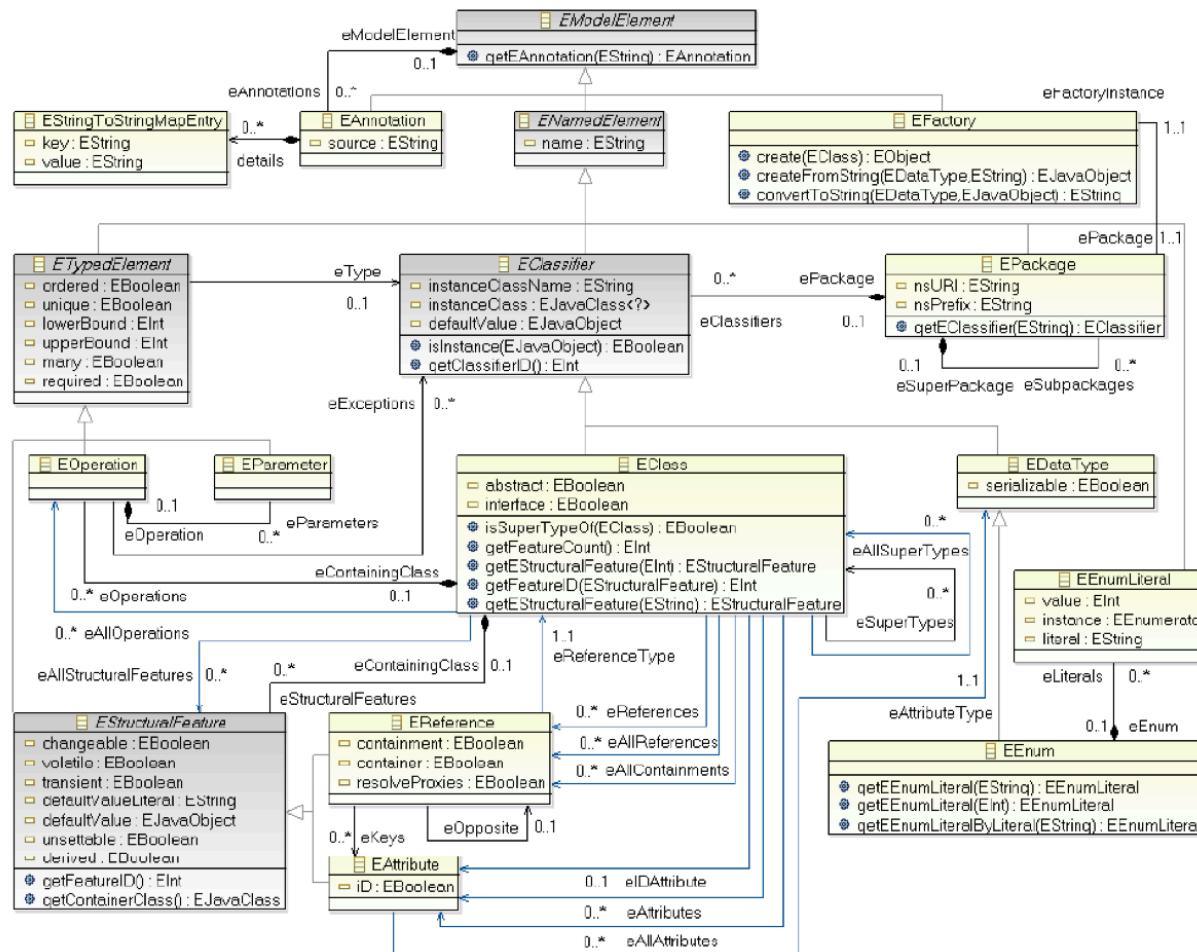

Quizz Time (4)

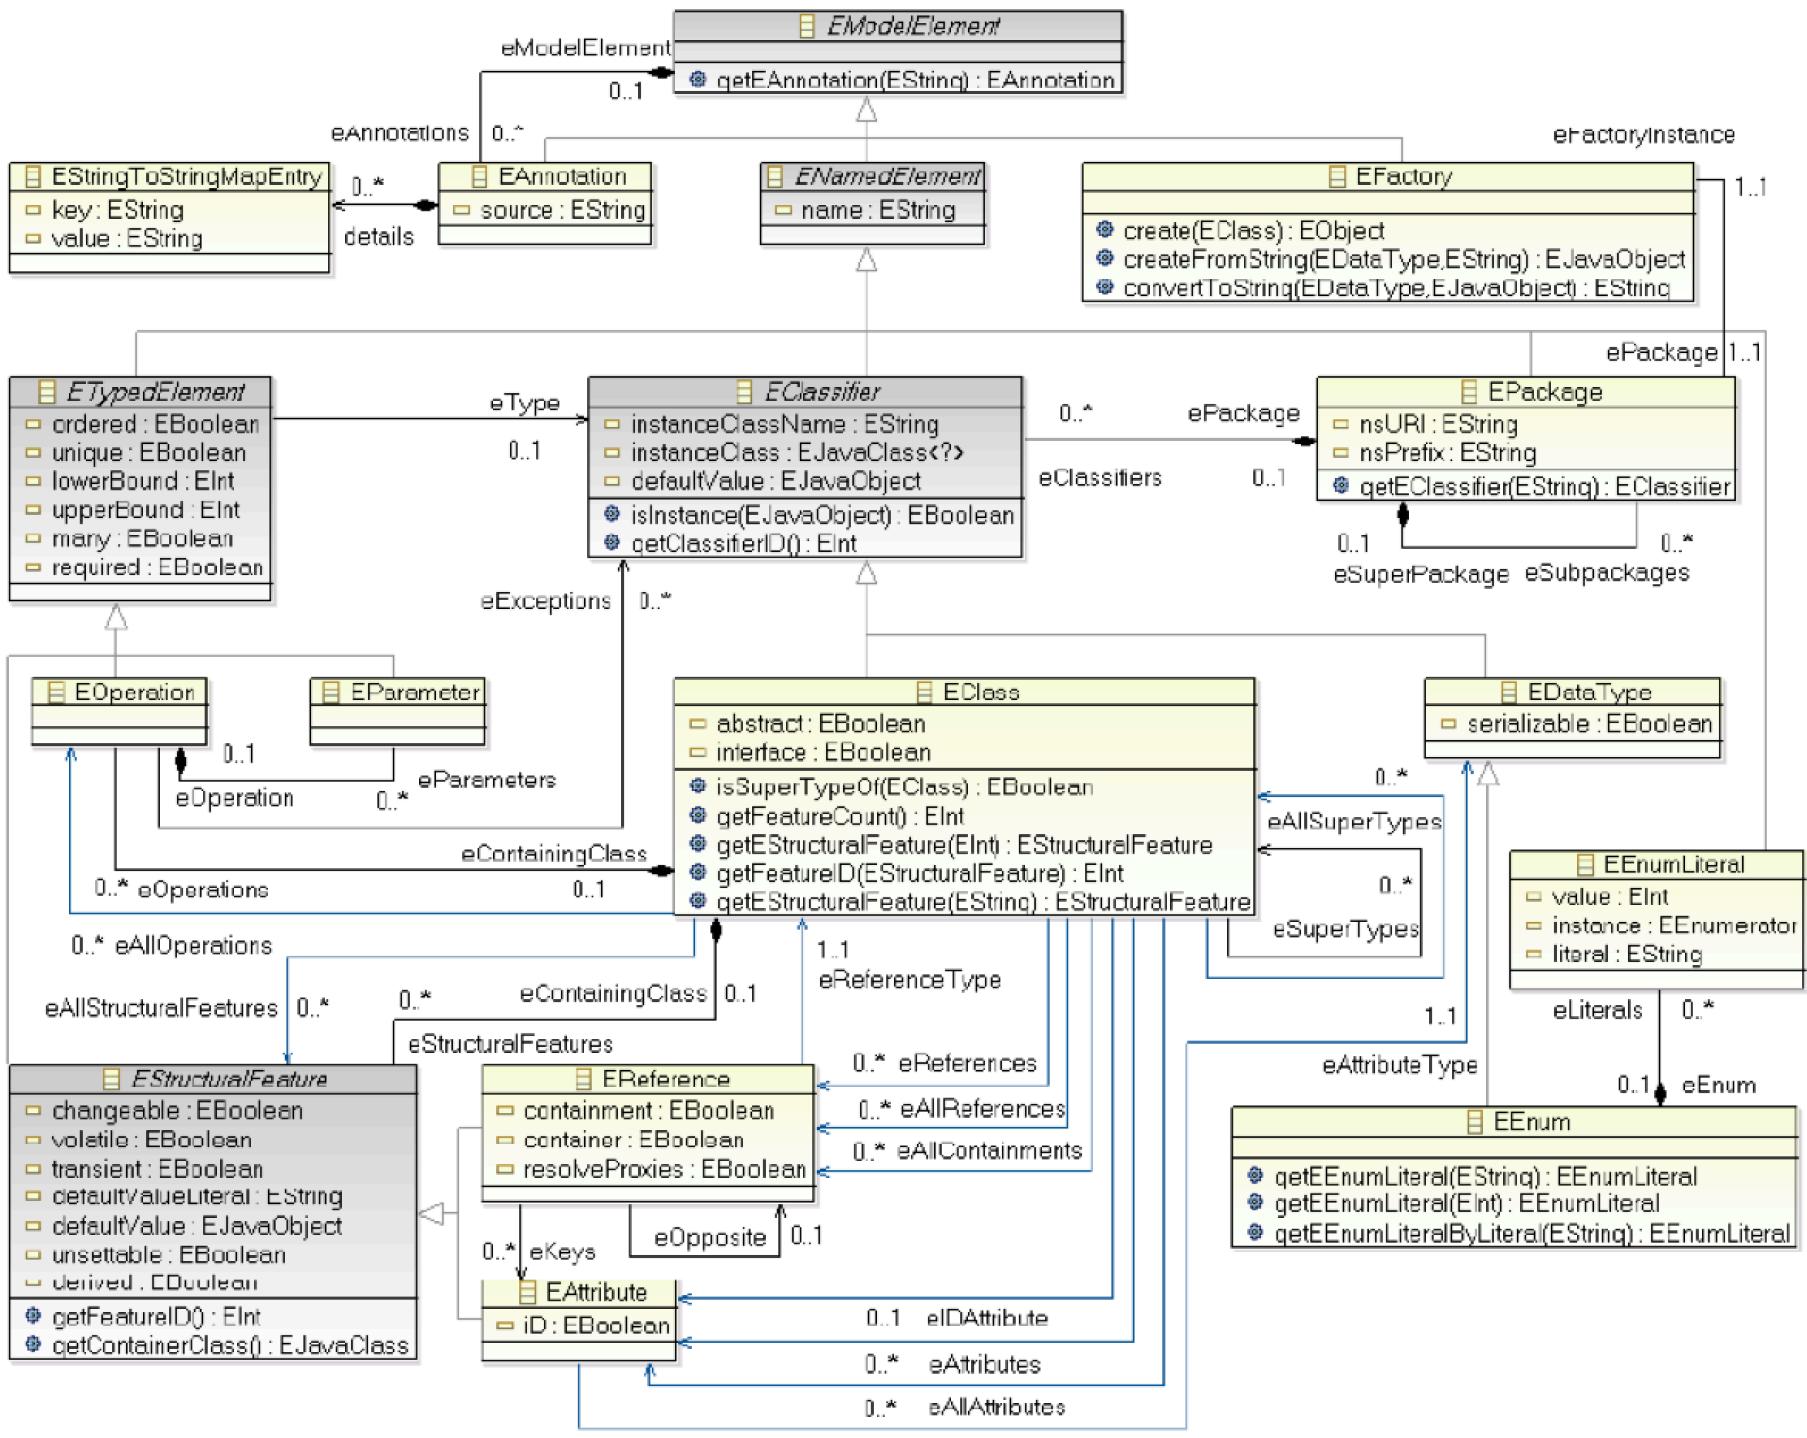

Write a Xtext grammar so that the specification below is conformant; what is the metamodel MM generated by Xtext?; **use the notation of object diagram for encoding the metamodel MM as a model conformant to Ecore**

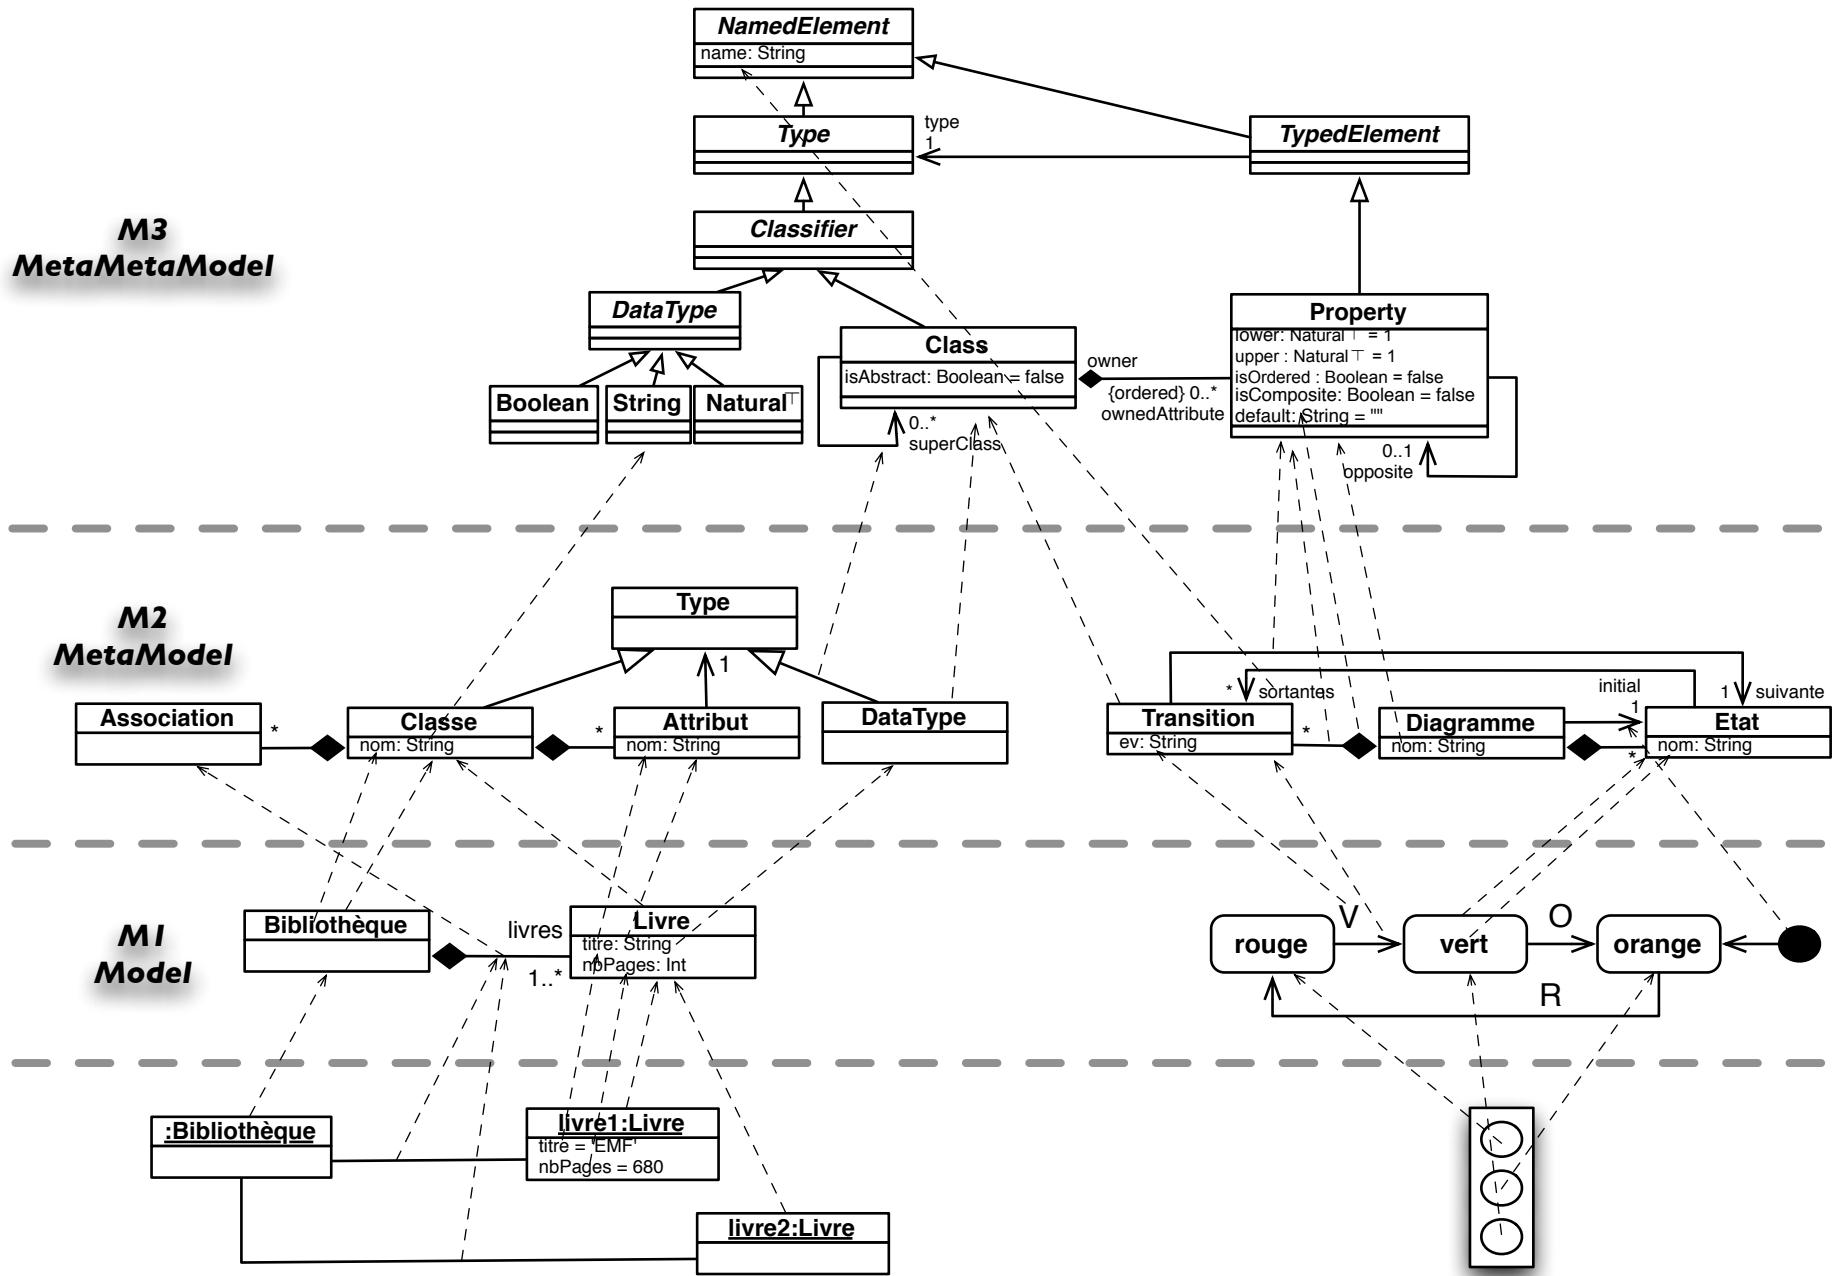

Quizz Time (5)

Use the notation of object diagram for encoding the Ecore metamodel as a model conformant to Ecore

Plan

- Model Management in a nutshell
 - Loading, serializing, transforming models: scenarios
 - Taxonomy
 - Model transformation in Xtend
- Xtend: a case study for GPL/DSL, MDE, and model transformation
 - Advanced features: extension methods, active annotations, template expressions
 - Xtend: behing the magic (Xtext+MDE)
 - Xtend + Xtext (breathing life into DSLs)
 - @Aspect annotation

Contract

- Practical foundations of model management
- Model transformations
 - Model-to-Text
 - Model-to-Model
 - Metaprogramming
- DSLs and model management: all together (Xtext + Xtend)

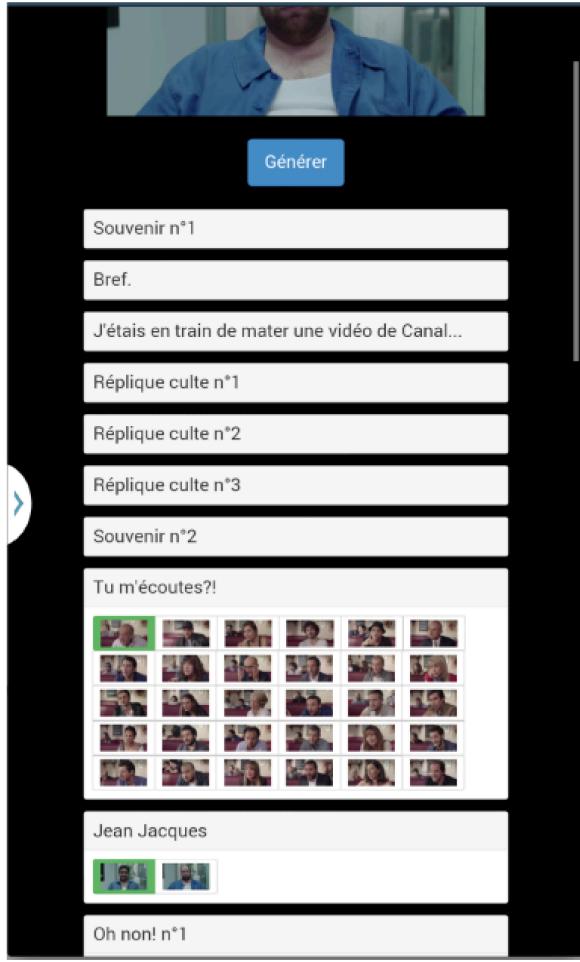

Model Management

Scenarios: illustrative
examples

Model Transformations

Taxonomy + Examples

Abstraction Gap

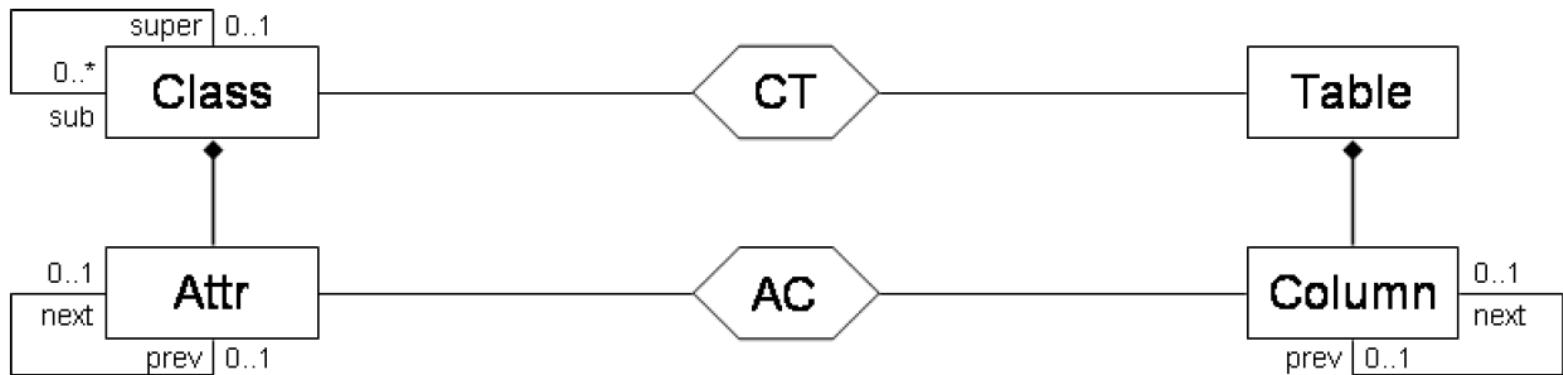

Transformation is the key

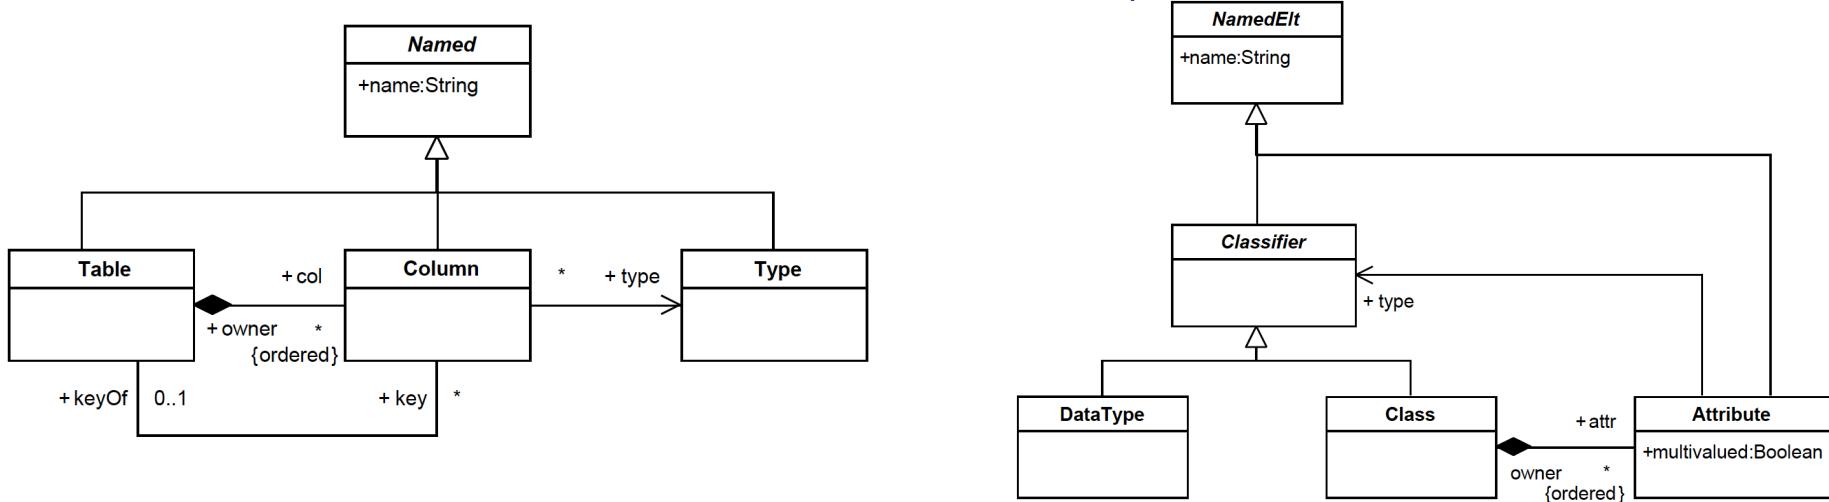

Andy Schürr, Felix Klar “15 Years of Triple Graph Grammars.” ICGT 2008

(declarative; bi-directionnal; model-to-model)

ATL (<http://www.eclipse.org/atl/atlTransformations/>)

```
rule Class2Table {
    from           -- source pattern
        c : Class!Class
    to             -- target pattern
        t : Relational!Table
    }
```

</ul>
```

Vertical Transformation

source and target models reside at the same abstraction level
(e.g., refactoring)

The diagram illustrates a vertical transformation between two Xtext-based models: `vidgen1.videogen` and `vidgen1-bis.videogen`. A vertical line connects the two models, indicating they are at the same abstraction level.

Source Model (`vidgen1.videogen`):

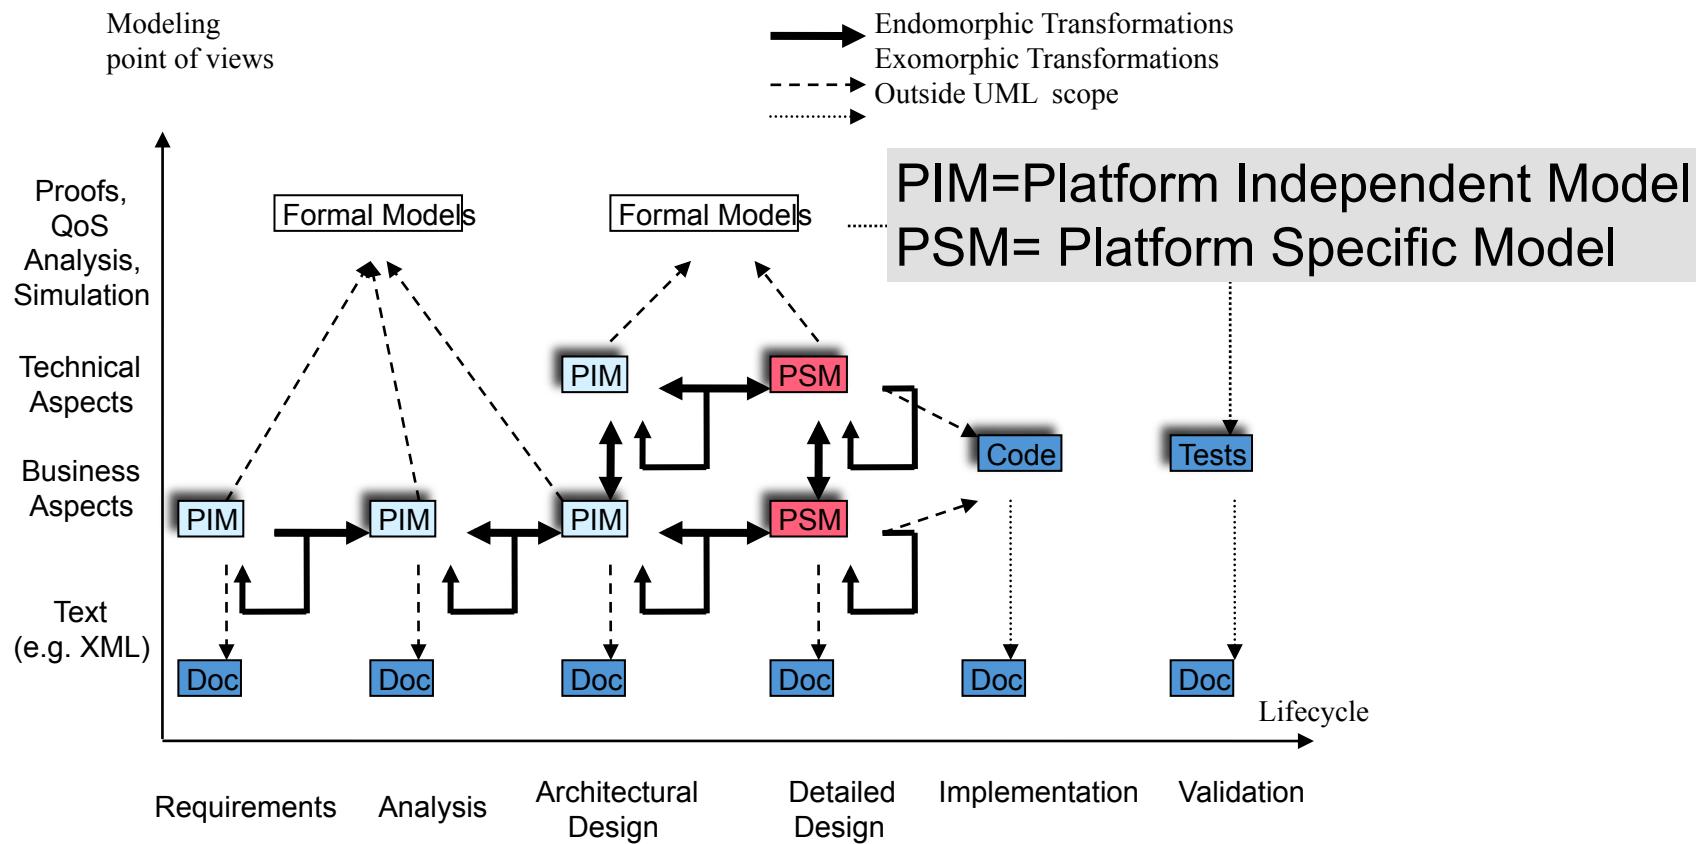

```
VideoGen {  
  
    mandatory videoseq "V1/v1.mp4"  
    optional videoseq "v2folder/v2.mp4" {  
        probability 25  
    }  
  
    alternatives vid3 {  
        videoseq "v3/seq1.mp4"  
        videoseq vid31 "v3/seq2.mp4"  
        videoseq vid32 "v3/seq3.mp4"  
    }  
  
    alternatives vid4 {  
        videoseq vid41 "v4/seq1.mp4"  
        videoseq vid42 "v4/seq2.mp4"  
    }  
    mandatory videoseq vid5 "v5.mp4"  
  
    optional videoseq vid8 "v8.avi"  
    alternatives vid9 {  
        videoseq vid81 "V81.avi"  
    }  
}
```

Target Model (`vidgen1-bis.videogen`):

```
VideoGen {  
  
    VideoGen1/vidgen1-bis.videogen  
        mandatory videoseq v0 "v1/v1.mp4"  
        optional videoseq v1 "v2folder/v2.mp4" {  
            probability 25  
        }  
        alternatives vid3 {  
            videoseq v2 "v3/seq1.mp4"  
            videoseq vid31 "v3/seq2.mp4"  
            videoseq vid32 "v3/seq3.mp4"  
        }  
        alternatives vid4 {  
            videoseq vid41 "v4/seq1.mp4"  
            videoseq vid42 "v4/seq2.mp4"  
        }  
        mandatory videoseq vid5 "v5.mp4"  
  
        optional videoseq vid8 "v8.avi"  
        alternatives vid9 {  
            videoseq vid81 "V81.avi"  
        }  
}
```

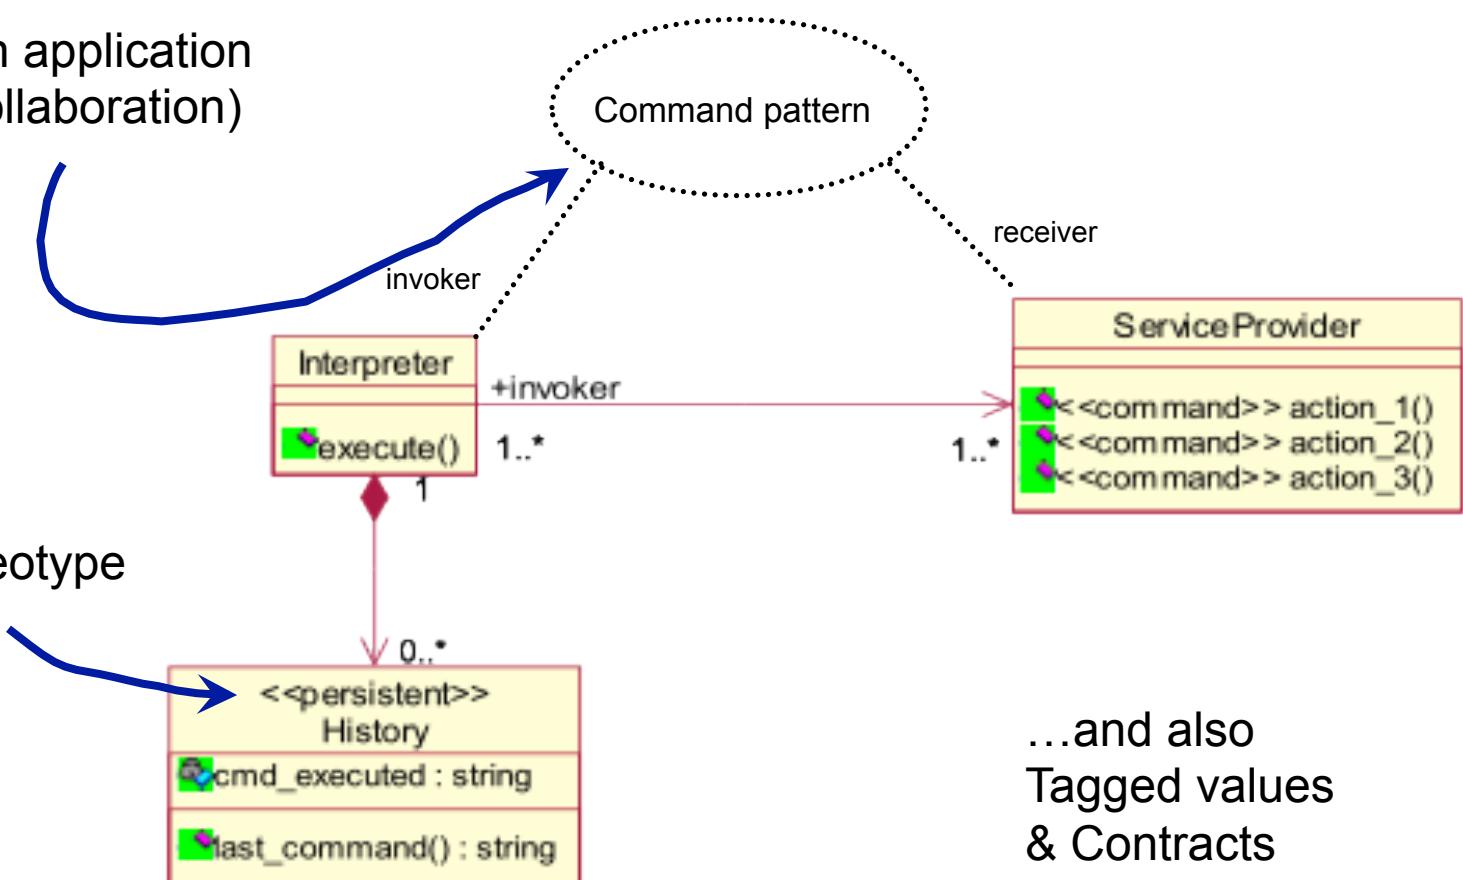

Chaining of Transformations

Back to the first courses

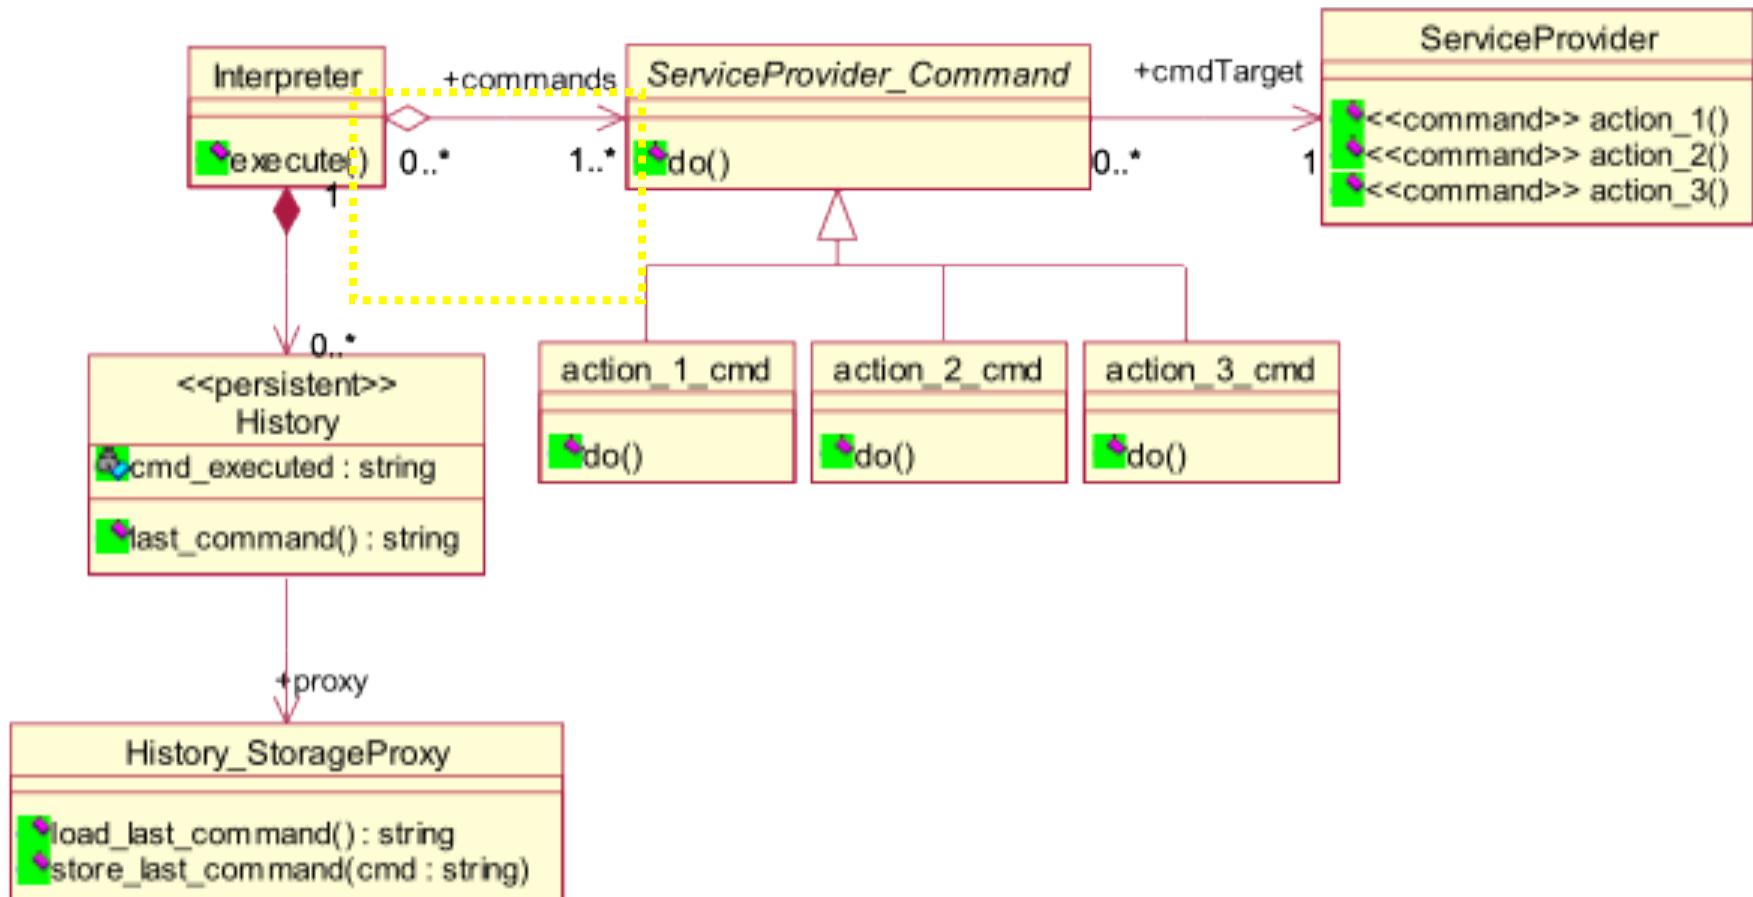

Embedding implicit semantics into a model

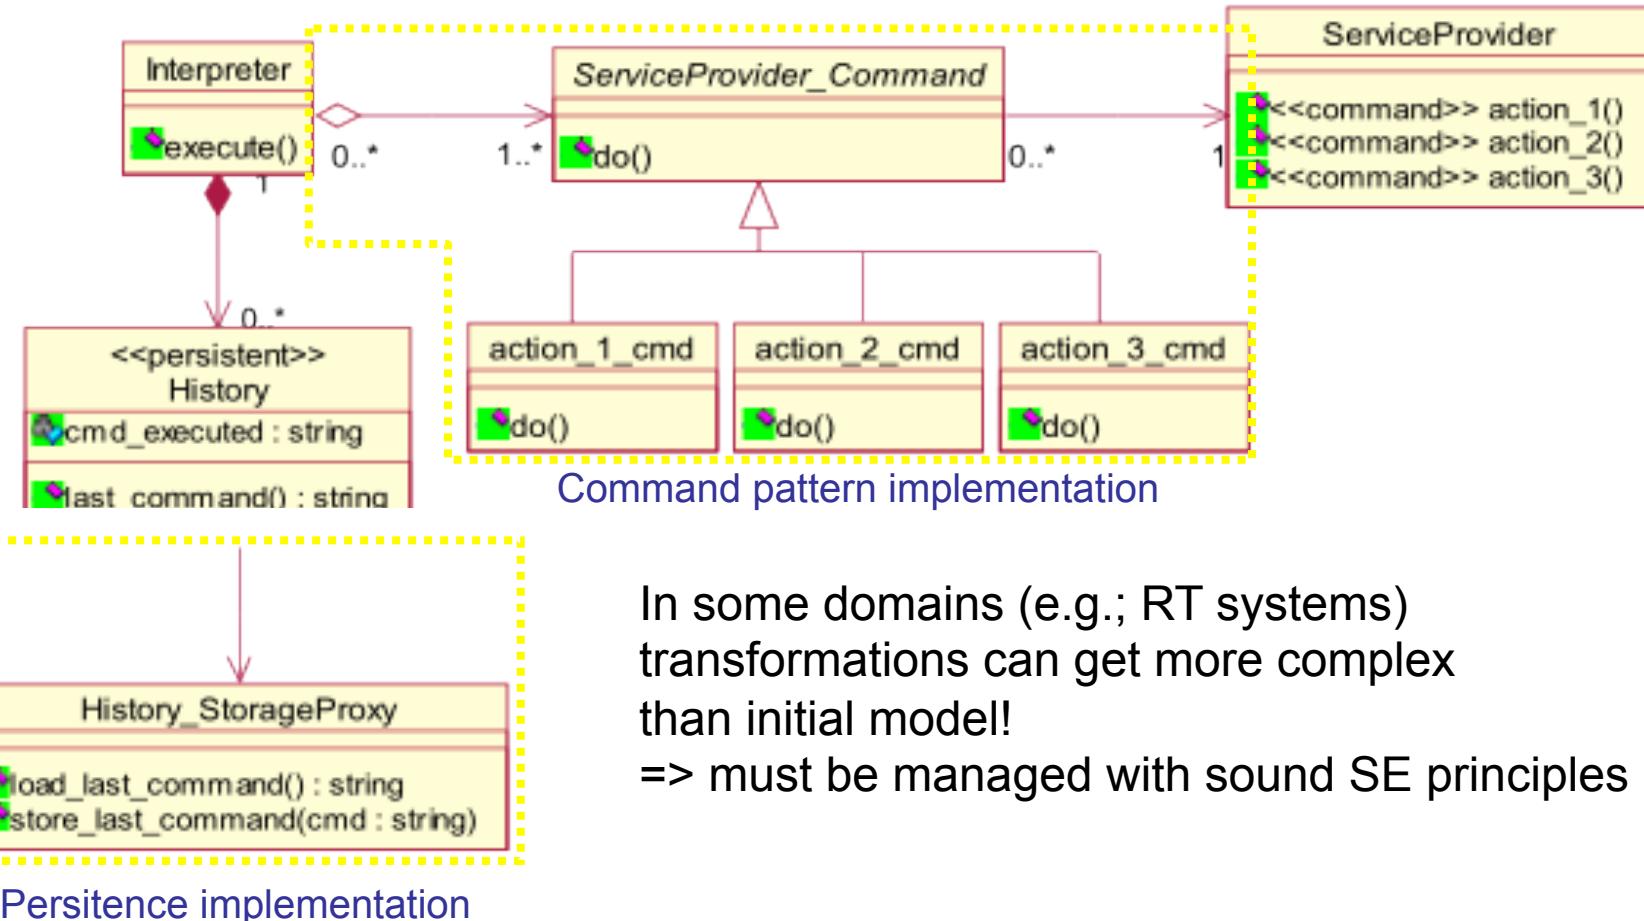

Design pattern application
(parametric collaboration)

...and the result we want...

How To: Automatic Model Transformations

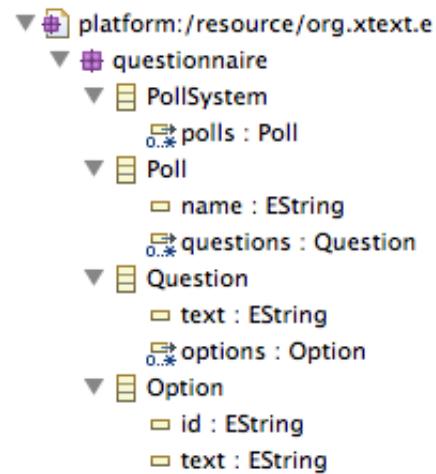

Quizz Time

Characterize the following model transformations

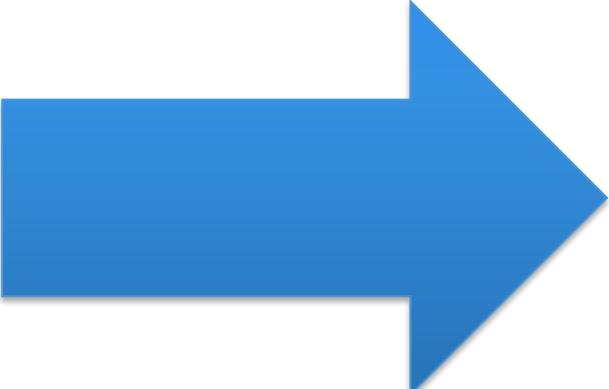

Endogeneous? Exogeneous?

Vertical? Horizontal?

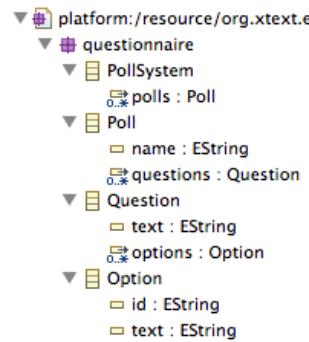

Model-to-text? Model-to-Model?

```
foo1.q
PollSystem {
    Poll poll1 {
        Question A {
            "What is A ?"
            options
                b : "B"
                c : "C"
                d : "D"
        }
    }
    Poll poll2 {
        Question D {
            "What is D ?"
            options
                e : "E"
                f : "F"
        }
    }
}
```

```
foo1.q   foo2.q
PollSystem {
    Poll poll1_poll {
        Question {
            "What is A ?"
            options
                b : "B"
                c : "C"
                d : "D"
        }
    }
    Poll poll2_poll {
        Question {
            "What is D ?"
            options
                e : "E"
                f : "F"
        }
    }
}
```

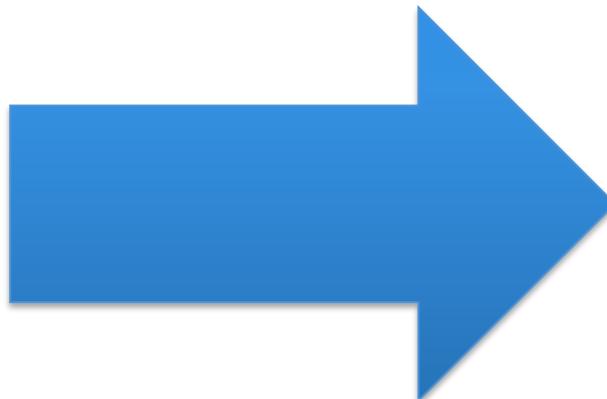

HTML

foo.q

```

PollSystem {
    Poll poll1 {
        Question A {
            "What is A ?"
            options
                b : "B"
                c : "C"
                d : "D"
        }
    }
    Poll poll2 {
        Question D {
            "What is D ?"
            options
                e : "E"
                f : "F"
        }
    }
}
  
```

poll1

What is A ?

- B
- C
- D

poll2

What is D ?

- E
- F

Quizz Time

Think about the different artefacts generated by Xtext.

What are the different transformations implemented in Xtext? Characterize them.

Model Transformation in Java/Xtend

Effective Model Management

- How to load/serialize a model?
- How to visit, analyze and transform models?
- You can do it in Java (EMF API)

- We arbitrarily choose  
– Java 10, interesting « features »
– Integration within Eclipse ecosystem (incl. Xtext)
and facilities to manage models
– An example of a sophisticated language

Before going into details of Xtend...

- Recap of the scenarios
 - Text-to-Model
 - Model(s)-to-Model transformation
 - Metamodels as a « bridge » between technologies
 - Model-to-Text
- The solution of some of the « scenarios »
 - Just to give an overview of Xtend capabilities
 - To give a more practical/concrete view of some of the previous scenarios

```

def loadVideoGenerator(URI uri) {
    new VideoGenStandaloneSetupGenerated().createInjectorAndDoEMFRegistration()
    var res = new ResourceSetImpl().getResource(uri, true);
    res.contents.get(0) as VideoGeneratorModel
}

```

```

def saveVideoGenerator(URI uri, VideoGeneratorModel pollS) {
    var Resource rs = new ResourceSetImpl().createResource(uri);
    rs.getContents.add(pollS);
    rs.save(new HashMap());
}

```

```

@Test
def test1() {
    // loading
    var videoGen = loadVideoGenerator(URI.createURI("foo2.videogen"))
    assertNotNull(videoGen)
    assertEquals(3, videoGen.videoseqs.size)
    // MODEL MANAGEMENT (ANALYSIS, TRANSFORMATION)
    videoGen.videoseqs.forEach[videoseq | 
        if (videoseq instanceof MandatoryVideoSeq) {
            val desc = (videoseq as MandatoryVideoSeq).description
            if(desc.videoid.isNullOrEmpty) desc.videoid = genID()
        }
        else if (videoseq instanceof OptionalVideoSeq) {
            val desc = (videoseq as OptionalVideoSeq).description
            if(desc.videoid.isNullOrEmpty) desc.videoid = genID()
        }
        else {
            val altvid = (videoseq as AlternativeVideoSeq)
            if(altvid.videoid.isNullOrEmpty) altvid.videoid = genID()
            for (vdesc : altvid.videodescs) {
                if(vdesc.videoid.isNullOrEmpty) vdesc.videoid = genID()
            }
        }
    ]
    // serializing
    saveVideoGenerator(URI.createURI("foo2bis.xmi"), videoGen)
    saveVideoGenerator(URI.createURI("foo2bis.videogen"), videoGen)

Probability	0
Videoid	v31

Loading Models (2)

Persistence of Models in XMI (XML Metadata Interchange)

The screenshot shows a modeling environment with two panes. The left pane displays a UML-like code editor for `foo3.videogen` containing:VideoGen {
 mandatory videoseq v1 "V1/v1.mp4"
 optional videoseq v2 "v2folder/v2.mp4"
 alternatives v3 {
 videoseq v31 "v31.mp4"
 videoseq v32 "v32.mp4"
 }
}The right pane shows the persisted XMI representation of the model:

```
<?xml version="1.0" encoding="ASCII"?>  
<videoGen:VideoGeneratorModel xmi:version="2.0" xmlns:xmi="http://www.omg.org/XMI">  
  <information/>  
  <videoseqs xsi:type="videoGen:MandatoryVideoSeq">  
    <description videoid="v1" location="V1/v1.mp4"/>  
  </videoseqs>  
  <videoseqs xsi:type="videoGen:OptionalVideoSeq">  
    <description videoid="v2" location="v2folder/v2.mp4"/>  
  </videoseqs>  
  <videoseqs xsi:type="videoGen:AlternativeVideoSeq" videoid="v3">  
    <videodescs videoid="v31" location="v31.mp4"/>  
    <videodescs videoid="v32" location="v32.mp4"/>  
  </videoseqs>  
</videoGen:VideoGeneratorModel>
```

A properties table at the bottom lists:

Property	Value
Description	
Duration	0
Location	v31.mp4
Probability	0
Videoid	v31

```
def loadPollSystem(URI uri) {
    new QuestionnaireStandaloneSetupGenerated().createInjectorAndDoEMFRegistration()
    var res = new ResourceSetImpl().getResource(uri, true);
    res.contents.get(0) as PollSystem
}
```

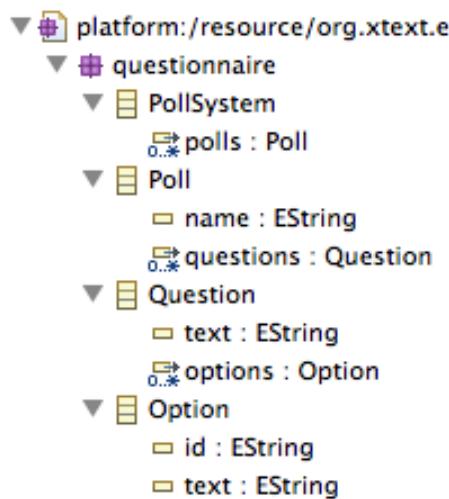

```
def savePollSystem(URI uri, PollSystem pollS) {
    var Resource rs = new ResourceSetImpl().createResource(uri);
    rs.getContents.add(pollS);
    rs.save(new HashMap());
}
```

```
@Test
def test1() {

    // loading
    var pollS = loadPollSystem(URI.createURI("foo1.q"))
    assertNotNull(pollS)
    assertEquals(2, pollS.polls.size)

    // MODEL MANAGEMENT (ANALYSIS, TRANSFORMATION)
    pollS.polls.forEach[p | p.name = p.name + "_poll"]

    // serializing
    savePollSystem(URI.createURI("foo2.q"), pollS)
}
```

Loading Models (1)

The screenshot illustrates the process of loading a Xtext model named `foo1.q`. The model defines a `PollSystem` containing two `Poll`s, each with a `Question` and multiple `Option`s.

Model Structure:

```
platform:/resource/org.xtext.e  
  questionnaire  
    PollSystem  
      polls : Poll  
    Poll  
      name : EString  
      questions : Question  
    Question  
      text : EString  
      options : Option  
    Option  
      id : EString  
      text : EString
```

Editor Selection Dialog:

Choose the editor for opening `foo1.q`:

- Internal editors
- External programs

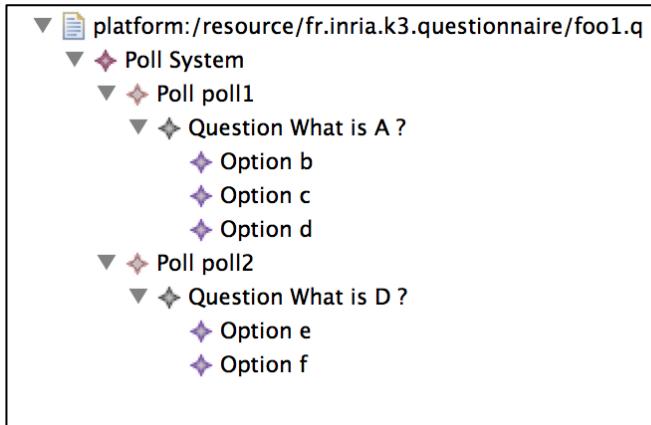

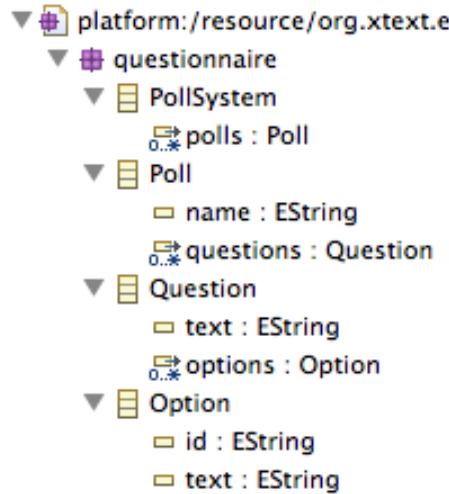

- PureXbase Editor
- Questionnaire Editor
- Questions Editor
- Reflective Xcore Model Editor
- Sample Ecore Model Editor**
- Sample Reflective Ecocore Model Editor
- Sample Reflective Ecocore XML Model Editor

Tree Viewer:

```
platform:/resource/fr.inria.k3.questionnaire/foo1.q  
  Poll System  
    Poll poll1  
      Question What is A ?  
        Option b  
        Option c  
        Option d  
    Poll poll2  
      Question What is D ?  
        Option e  
        Option f
```

} // Poll
```

Meta(models) and Java

The screenshot shows the generated Java code for the Poll class. The code includes annotations for generated methods and fields, and comments explaining the meaning of various attributes and their values.

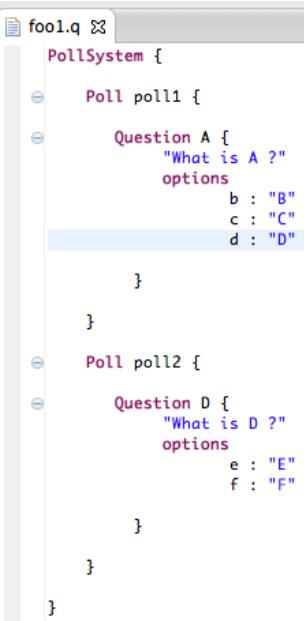

```
public interface Poll extendsEObject
{
    /**
     * Returns the value of the '<em><b>None</b></em>' attribute.
     * <!-- begin-user-doc -->
     * <!-- The meaning of the '<em>None</em>' attribute isn't clear,
     * there really should be more of a description here...
     * <!-- end-user-doc -->
     * Return the value of the '<em>None</em>' attribute.
     * @see org.xtext.example.mydsl.questionnaire.QuestionnairePackage#getPoll_None()
     * @model
     * @generated
     */
    String getName();

    /**
     * Sets the value of the '(link org.xtext.example.mydsl.questionnaire.Poll#getName <em>Name</em>)' attribute.
     * <!-- begin-user-doc -->
     * <!-- end-user-doc -->
     * Set the new value of the '<em>Name</em>' attribute.
     * @param newName
     * @generated
     */
    void setName(String newValue);

    /**
     * Returns the value of the '<em><b>Questions</b></em>' containment reference list.
     * The list contents are of type '(link org.xtext.example.mydsl.questionnaire.Question)'.
     * <!-- begin-user-doc -->
     * <!-- The meaning of the '<em>Questions</em>' containment reference list isn't clear,
     * there really should be more of a description here...
     * <!-- end-user-doc -->
     * Return the value of the '<em>Questions</em>' containment reference list.
     * @see org.xtext.example.mydsl.questionnaire.QuestionnairePackage#getPoll_Questions()
     * @model containment="true"
     * @generated
     */
    EList<Question> getQuestions();
}

// // Poll
```

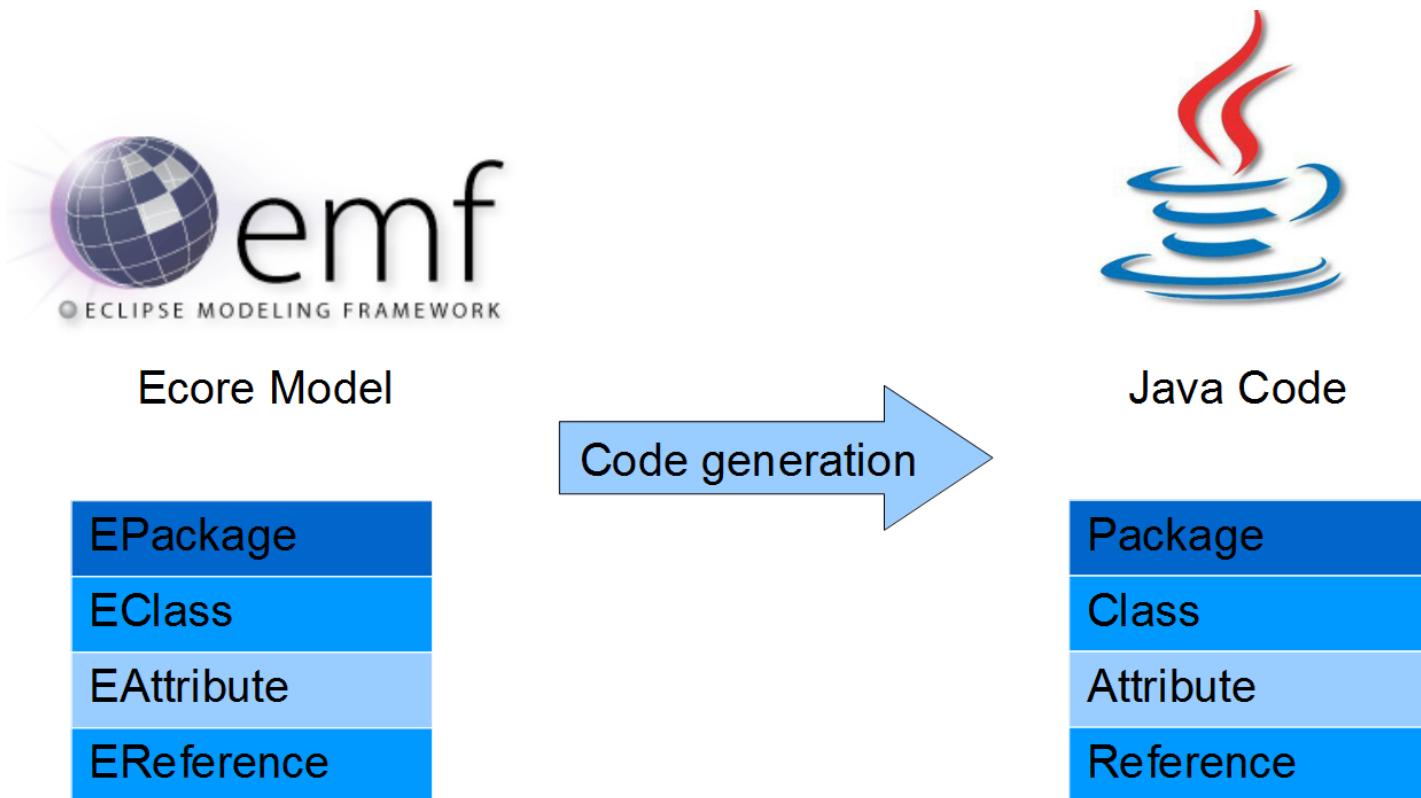

« Eclipse Modeling Framework (EMF)
runtime support to produce a set of Java classes for the model »

The screenshot shows the Xtext grammar file 'fool.q'. It defines a 'PollSystem' containing multiple 'Poll' objects. Each 'Poll' has a question and a list of options ('a' through 'f').

```
fool.q
PollSystem {
    Poll poll1 {
        Question A {
            "What is A ?"
            options
                b : "B"
                c : "C"
                d : "D"
        }
    }
    Poll poll2 {
        Question D {
            "What is D ?"
            options
                e : "E"
                f : "F"
        }
    }
}
```

Grammar and Metamodel

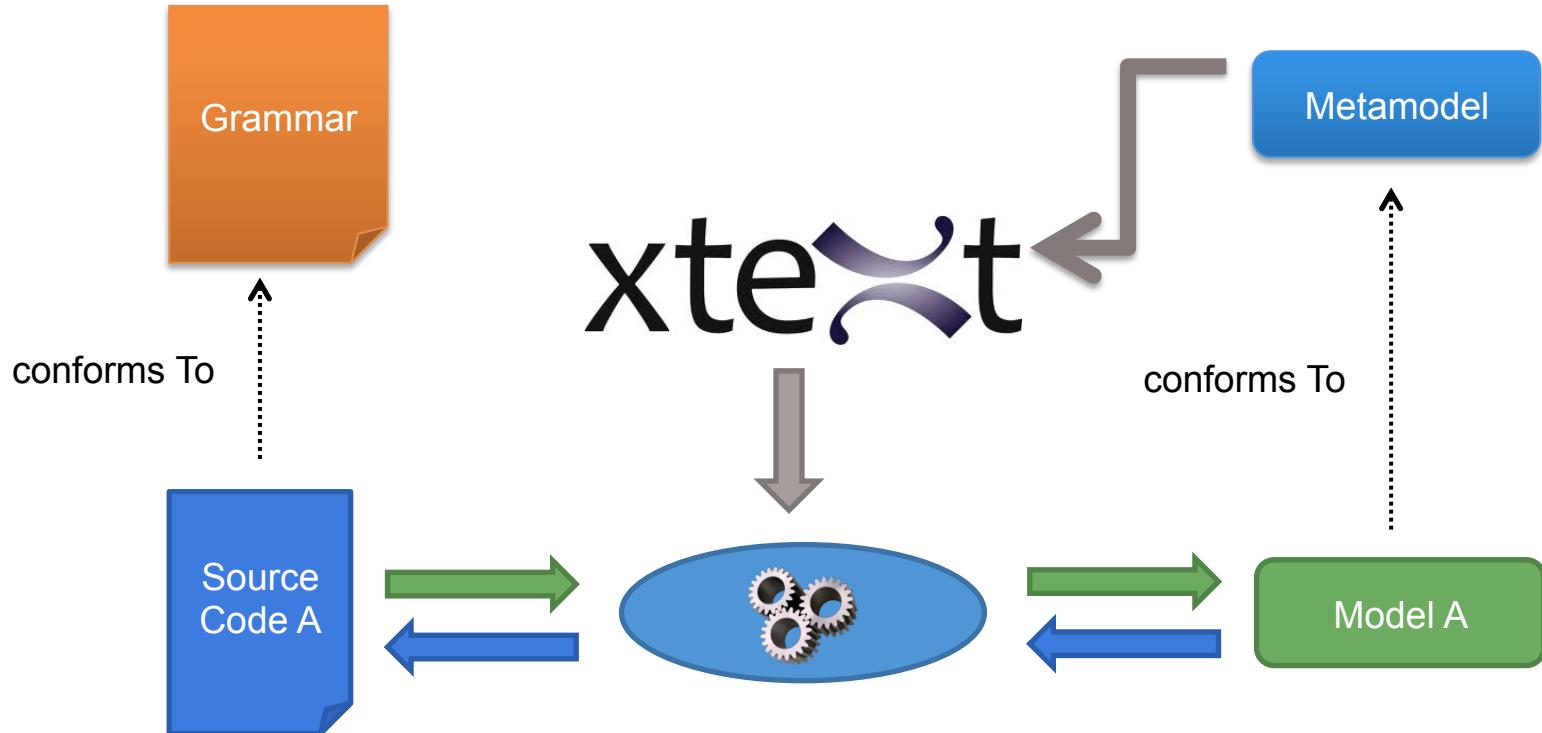

- Model transformations are defined on top of metamodel constructs
- **Co-design** of grammar and metamodel
 - Grammar defines the syntax
 - Metamodel defines the structure
 - Xtext facilitates the metamodel design with
 - Default rules for inferring the metamodel from the grammar
 - Facilities to parameterize the inference
- Some transformations may be difficult to express. In this case two possible attitudes:
 - Revise the Xtext grammar and the underlying metamodel
 - Design another metamodel (from scratch) and write a model-to-model transformation

From Metamodel

To

Grammar (other side)

From Metamodel to Grammar

Give me a **metamodel**,

I'll give you (for free)

- * a comprehensive editor (auto-completion, syntax highlighting, etc.) in Eclipse
- * a grammar and facilities to load/serialize/visit conformant models (Java ecosystem)
- * extension to override/extend « default » facilities (e.g., checker)

Give me a **metamodel**,

The grammar can be « weird » (i.e., not as concise and as comprehensible than if you made it manually)

[Same observation actually applies to the other side: generated metamodels (from grammar) can be weird as well, but you have at least some control in Xtext-based grammar]
[We will experiment in the lab sessions]

Entry rule:

PollSystem - questionnaire

?

< Back Next > Cancel Finish

Questionnaire.xtext Questionnaire.ecore Questionnaire.xtext Questionnaire.ecore Questionnaire2.xtext

```
// automatically generated by Xtext
grammar org.xtext.example.mydsl.Questionnaire2 with org.eclipse.xtext.common.Terminal

import "http://www.xtext.org/example/mydsl/Questionnaire"
import "http://www.eclipse.org/emf/2002/Ecore" as ecore

PollSystem returns PollSystem:
    {PollSystem}
    'PollSystem'
    '{'
        ('polls' '{' polls+=Poll ( "," polls+=Poll)* '}' )?
    '}';
    13
    14
    15
    16

Poll returns Poll:
    {Poll}
    'Poll'
    name=EString
    '{'
        ('questions' '{' questions+=Question ( "," questions+=Question)* '}' )?
    '}';
    24

EString returns ecore::EString:
    STRING | ID;
    27

Question returns Question:
    {Question}
    'Question'
    '{'
        ('id' id=EString)?
        ('text' text=EString)?
        ('options' '{' options+=Option ( "," options+=Option)* '}' )?
    '}';
    36

Option returns Option:
    {Option}
    'Option'
    '{'
        ('id' id=EString)?
        ('text' text=EString)?
    '}';
    44
```

Quizz Time

Explain (roughly) the « algorithm » of Xtext to generate a grammar from an ecore Metamodel

Plan

- Model Management in a nutshell
 - Loading, serializing, transforming models: scenarios
 - Taxonomy
 - Model transformation in Xtend
- Xtend: a case study for GPL/DSL, MDE, and model transformation
 - Advanced features: extension methods, active annotations, template expressions
 - Xtend: behing the magic (Xtext+MDE)
 - Xtend + Xtext (breathing life into DSLs)
 - @Aspect annotation

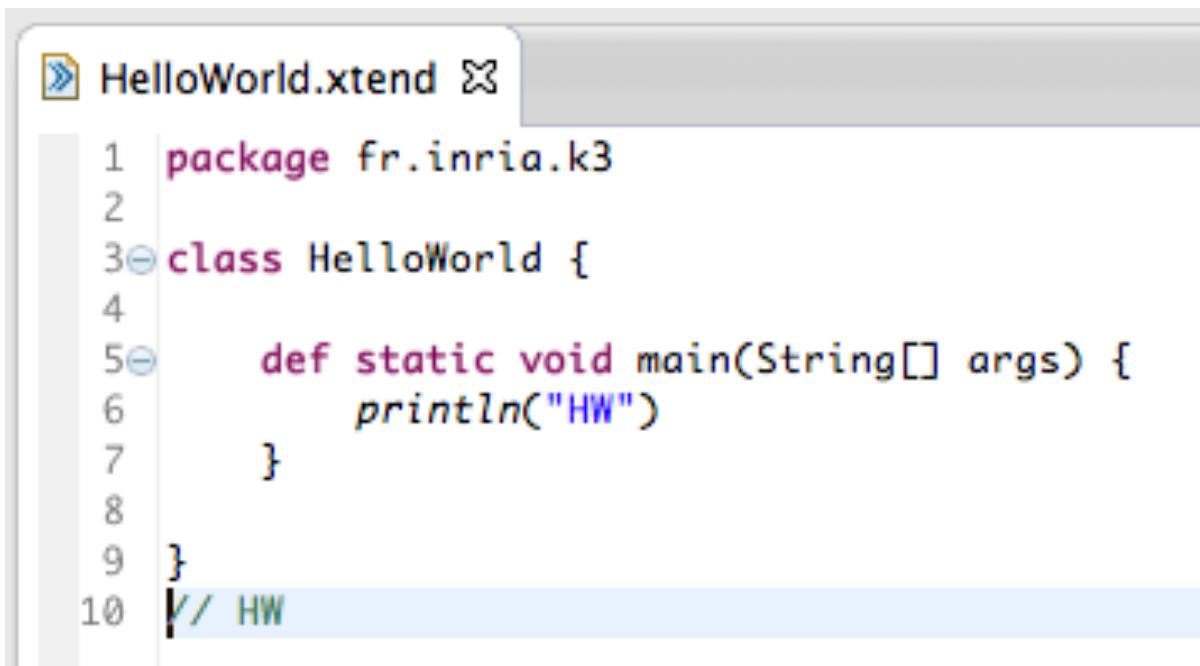

Contract

- Practical foundations of model management
- Model transformations
 - Model-to-Text
 - Model-to-Model
 - Metaprogramming
- DSLs and model management: all together (Xtext + Xtend)

Xtend

A pragmatic general-purpose language
implemented using MDE
techniques

Hello World

The image shows a screenshot of a code editor window. The title bar of the window reads "HelloWorld.xtend". The main area of the editor displays the following Java-like code:

```
1 package fr.inria.k3
2
3 class HelloWorld {
4
5     def static void main(String[] args) {
6         println("HW")
7     }
8
9 }
10 // HW
```

Semi-colon is optional (within class, methods, etc.)

```
1 package fr.inria.k3.fields
2
3 class MyFielder {
4
5     int count = 1
6     static boolean debug = false
7     var name = 'Foo'           // type String is inferred
8     val UNIVERSAL_ANSWER = 42 // final field with inferred type int
9     // ...
10    public int count2 = 2 ;
11
12 }
```

Package Declaration

A screenshot of a code editor showing the `HelloWorld.xtend` file. The code is:1 package fr.inria.k3
2
3 class HelloWorld {
4
5 def static void main(String[] args) {
6 println("HW")
7 }
8
9 }
10 // HW

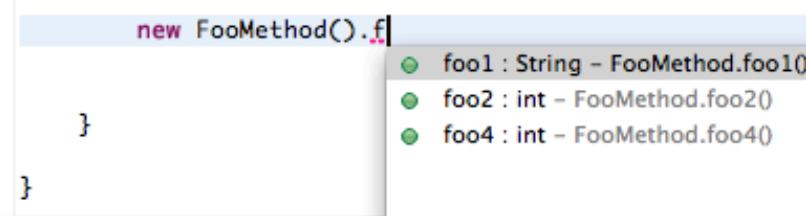

Semi-colon ';' is optional

A screenshot of a code editor showing two files: `HelloWorld.xtend` and `PackageExploder.xtend`. The `HelloWorld.xtend` file contains:1 package fr.inria.k3.^def
2
3 class PackageExploder {
4
5 }The `PackageExploder.xtend` file is also visible.

'^' for avoiding keyword conflicts

Methods

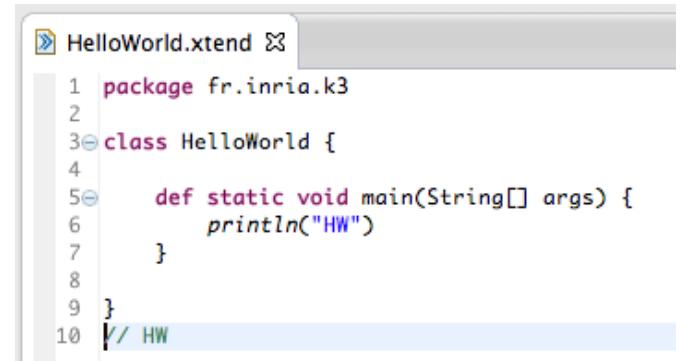

```
1 package fr.inria.k3.methods
2
3 class FooMethod {
4
5     def foo1() {
6         "A"
7     }
8
9     def foo2() {
10        6 + 3
11    }
12
13     def private foo3() {
14        6 + 3
15    }
16
17     def public foo4() {
18        foo3() * 8
19    }
20 }
21
22 class FooMethodUses {
23
24     def fooUse() {
25         new FooMethod().foo1
26         new FooMethod().foo3()
27
28
29
30         new FooMethod().f
31
32
33     }
34
35 }
```

The code above defines a class `FooMethod` with four methods: `foo1`, `foo2`, `foo3`, and `foo4`. The `foo3` method is marked as `private`. In the `FooMethodUses` class, the `fooUse` method attempts to call `foo3`, which is highlighted in red, indicating it's a `private` method and thus inaccessible from outside the class.

**By default:
visibility
conditions set
to public**

```
>HelloWorld.xtext
1 package fr.inria.k3
2
3 class HelloWorld {
4
5     def static void main(String[] args) {
6         println("HW")
7     }
8
9 }
10 // HW
```

Methods

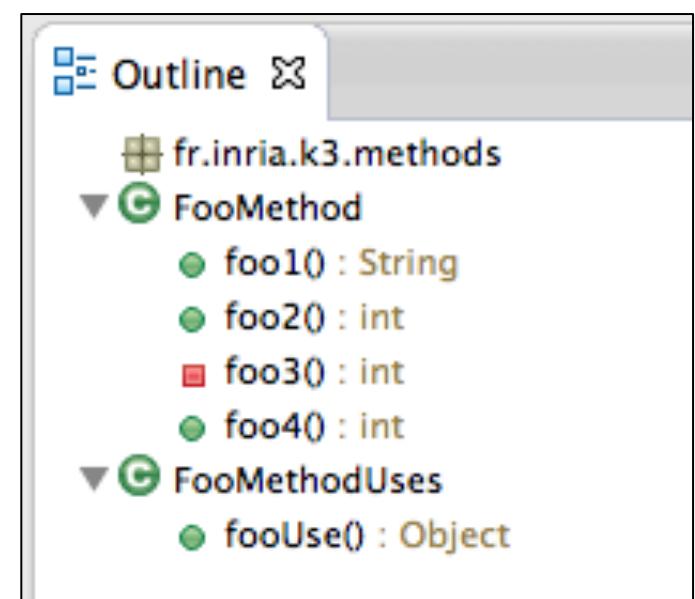

```
1 package fr.inria.k3.methods
2
3 class FooMethod {
4
5     def foo1() {
6         "A"
7     }
8
9     def foo2() {
10        6 + 3
11    }
12
13     def private foo3() {
14        6 + 3
15    }
16
17     def public foo4() {
18        foo3() * 8
19    }
20 }
21
22 class FooMethodUses {
23
24     def fooUse() {
25         new FooMethod().foo1
26         new FooMethod().foo3()
27
28
29
30         new FooMethod().f|
```

new FooMethod().f|

- foo1 : String – FooMethod.foo1()
- foo2 : int – FooMethod.foo2()
- foo4 : int – FooMethod.foo4()

```
31
32
33     }
34
35 }
```

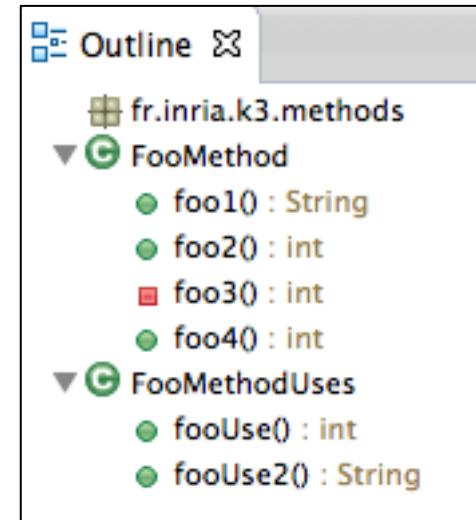

Type inference (return type)

Method Calling

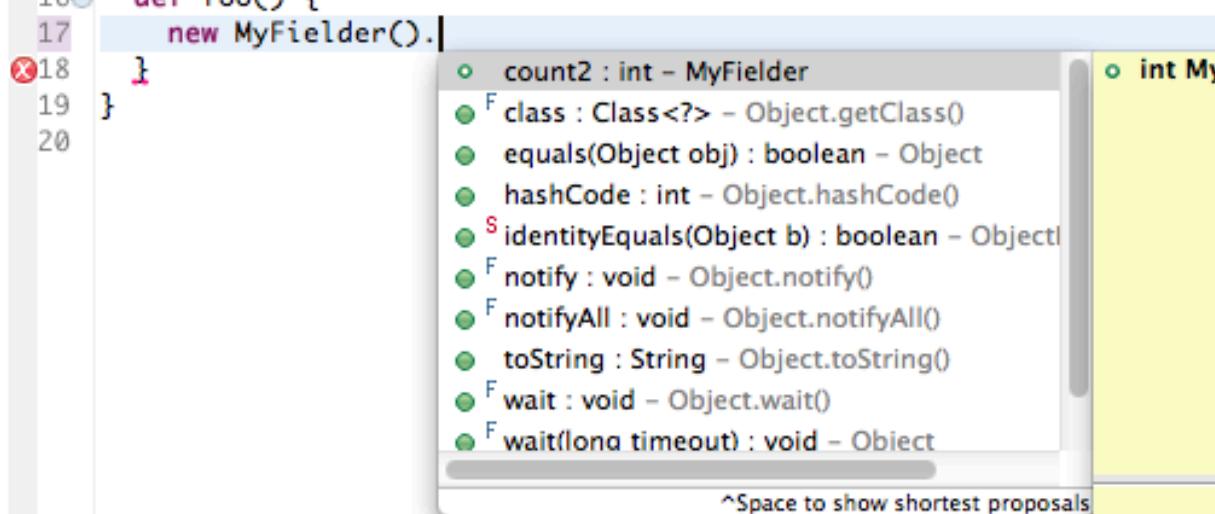

You can omit
parentheses

```
33@    def fooUse2() {  
34        3.toString  
35        "4".length  
36        new FooMethod().foo1  
37        new FooMethod().foo1()  
38        new FooMethod().foo1 + 3.toString  
39    }  
40 }
```

Fields

```
1 package fr.inria.k3.fields
2
3 class MyFielder {
4
5     int count = 1
6     static boolean debug = false
7     var name = 'Foo'          // type String is inferred
8     val UNIVERSAL_ANSWER = 42 // final field with inferred type int
9     // ...
10    public int count2 = 2 ;
11
12 }
13
14 class MyAccessor {
15
16     def foo() {
17         new MyFielder().|
18     }
19 }
20
```

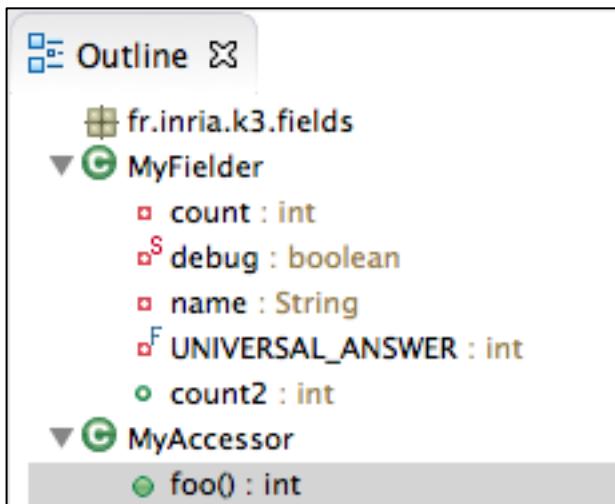

The screenshot shows a Java code editor with two classes: MyFielder and MyAccessor. The MyFielder class contains several fields and methods, some with annotations like `// type String is inferred` or `// final field with inferred type int`. In the MyAccessor class, there is a call to `new MyFielder().`, which triggers an IDE's code completion feature. A dropdown menu appears, listing the available methods of the `MyFielder` class: `count2`, `getClass`, `equals`, `hashCode`, `identityEquals`, `notify`, `notifyAll`, `toString`, `wait`, and `waitWithTimeout`. The method `count2` is currently selected. At the bottom of the completion dropdown, there is a tooltip that says `^Space to show shortest proposals`.

**By default:
visibility
conditions set
to private**

Fields

```
1 package fr.inria.k3.fields
2
3 class MyFielder {
4
5     int count = 1
6     static boolean debug = false
7     var name = 'Foo'           // type String is inferred
8     val UNIVERSAL_ANSWER = 42 // final field with inferred type int
9     ...
10    public int count2 = 2 ;
11
12 }
13
```

primitive types of Java (int, boolean, etc) with autoboxing

var: type inference

val: constant, « final » in Java

Static Methods (::)

```
1 package fr.inria.k3.stat
2
3 import java.util.Collections
4
5@ class FooStati {
6
7
8     static var colors = newArrayList(46, 76, 89, 53)
9
10
11@ def static void main(String... args) {
12     println("B " + colors)
13     Collections::sort(colors)
14     println("A " + colors)
15
16     colors.add(45)
17     println("A " + colors)
18
19 }
20 }
```

```
B [46, 76, 89, 53]
A [46, 53, 76, 89]
A [46, 53, 76, 89, 45]
```

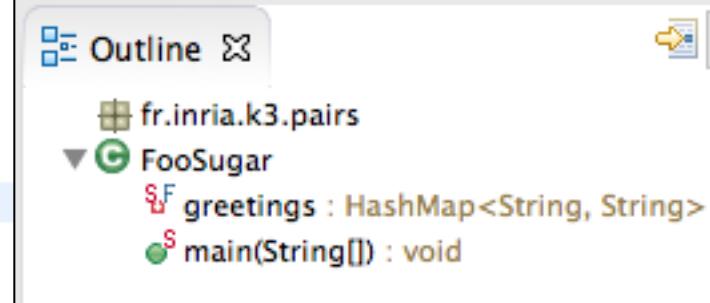

Pairs

```
1 package fr.inria.k3.pairs
2
3 class FooSugar {
4
5     // syntactic sugar
6     val pair = "spain" -> "italy"
7     var k = pair.key
8     var v = pair.value
9
10 def foo() {
11
12     println("key=" + k + " value=" + v)
13
14 }
15 }
```

Pairs

```
1 package fr.inria.k3.pairs
2
3 class FooSugar {
4
5
6     static val greetings = newHashMap(
7         "german" -> "Hallo",
8         "english" -> "Hello",
9         "french" -> "Bonjour"
10    )
11
12 def static main(String... args) {
13     greetings.forEach[key, value | println("HW in " + key + " : " + value)]
14 }
15
16 }
```

The screenshot shows the Eclipse IDE interface with the 'Console' tab selected. The console output window displays the following text:
<terminated> FooSugar [Java Application] /Library/Java/JavaVirtualMa
HW in english : Hello
HW in french : Bonjour
HW in german : Hallo

Immutable data structure

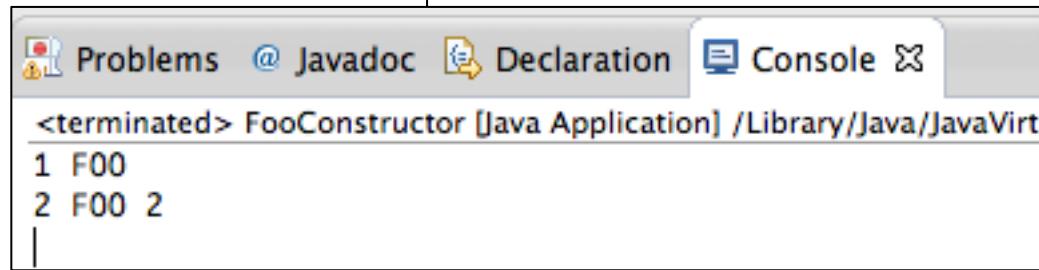

```
1 package fr.inria.k3.stat
2
3 import java.util.Collections
4
5 class FooStati {
6
7
8     static var colors = #[46, 76, 89, 53] // newArrayList(46, 76, 89, 53)
9
10
11 def static void main(String... args) {
12     println("B " + colors)
13     Collections::sort(colors)
14     println("A " + colors)
15
16     colors.add(45)
17     println("A " + colors)
18
19 }
20 }
```

```

Constructor

Default visibility: public

```
1 package fr.inria.k3.classes
2
3 class FooConstructor {
4
5     var String l
6
7     new() {
8         this("FOO")
9     }
10
11    new (String v) {
12        l = v
13    }
14
15
16    override toString() {
17        l
18    }
19
20    def static void main (String... args) {
21        println("1 " + new FooConstructor())
22        println("2 " + new FooConstructor("FOO 2"))
23    }
24 }
```

override keyword:
mandatory

Cast and Type

```
1 package fr.inria.k3.types
2
3 class FooTypes {
4
5     static val Object obj = "a string"
6     // static val String s = obj
7     static val String s = obj as String // cast
8
9     def static void main(String... args) {
10         println(typeof(String) + "") // String.class
11         println("\t" + s + "\n")
12     }
13 }
14 }
```

Extension Methods...

« ... allow to add new methods to existing types without modifying them. »

```
def removeVowels (String s){  
    s.replaceAll("[aeiouAEIOU]", "")  
}
```

We can call this method either like in Java:

```
removeVowels("Hello")
```

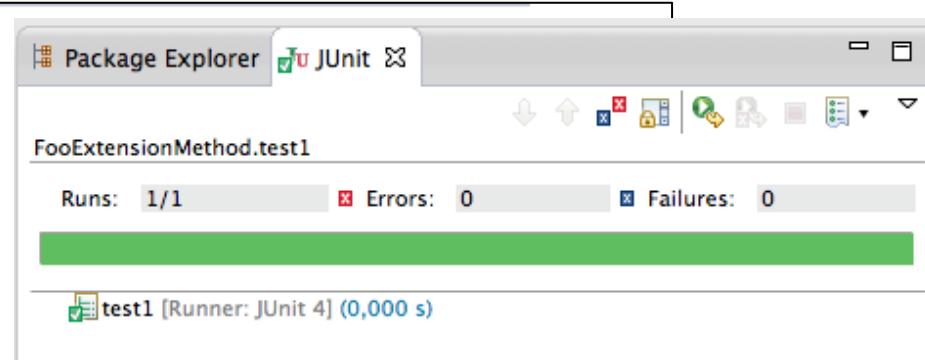

or as an extension method of String:

```
"Hello".removeVowels
```

The first parameter of a method can either
be passed in after opening the
parentheses or before the method call

Extension Method (local)

```
1 package fr.inria.k3.methods
2
3 import org.junit.Test
4 import static org.junit.Assert.*
5
6 class FooExtensionMethod {
7
8
9     def removeVowels (String s){
10         s.replaceAll("[aeiouAEIOU]", "")
11     }
12
13     def foo() {
14         "HelloWorld".removeVowels
15     }
16
17     @Test
18     def test1() {
19         assertEquals("HllWrld", new FooExtensionMethod().foo)
20     }
21 }
```

Extension Method (library)

```

Lambda Expression

(Java 8 will support it)

Anonymous classes can be found everywhere in Java code...

```
1. // Java Code!
2. final JTextField textField = new JTextField();
3. textField.addActionListener(new ActionListener() {
4.     @Override
5.     public void actionPerformed(ActionEvent e) {
6.         textField.setText("Something happened!");
7.     }
8. });
```

... And have always been the poor-man's replacement for lambda expressions in Java.

Lambda Expression (Xtend answer)

Anonymous classes can be found everywhere in Java code...

```
1. // Java Code!
2. final JTextField textField = new JTextField();
3. textField.addActionListener(new ActionListener() {
4.     @Override
5.     public void actionPerformed(ActionEvent e) {
6.         textField.setText("Something happened!");
7.     }
8. });
```

No need to
specify the
type for e

```
1. textField.addActionListener([ e |
2.     textField.text = "Something happened!"
3. ])
```

You can even
ommit e

```
1. textField.addActionListener([
2.     textField.text = "Something happened!"
3. ])
```

Lambda Expression

(Xtend answer, more impressive examples)

```
1. Collections.sort(someStrings) [ a, b |  
2.     a.length - b.length  
3. ]
```

Java 8: shapes.forEach(s -> { s.setColor(RED); });

Xtend: shapes.forEach[color = RED]

Java 8:

```
shapes.stream()  
    .filter(s -> s.getColor() == BLUE)  
    .forEach(s -> { s.setColor(RED); });
```

Xtend:

```
shapes.stream  
    .filter[color == BLUE]  
    .forEach[color = RED]
```

Lambda Expression

(Xtend answer, more impressive examples)

```
class FooLambda {

    val l = [String s | s.length]
    var (String)=>int l2 = [it.length] // it is a keyword for referring to the first parameter
    var (String)=>int l3 = [length] // we can even omit it or the first parameter

    @Test
    def test1() {
        assertEquals(l.apply ("RRRR"), l2.apply("PPPP"))
        assertEquals(l2.apply ("RRRR"), l3.apply("PPPP"))
    }
}
```

▼  FooLambda

- l : Function1<String, Integer>
- l2 : (String)=>int
- l3 : (String)=>int
- test1() : void

Templates

```
1 package fr.inria.k3.templates
2
3 import org.junit.Test
4 import static org.junit.Assert.*
5
6 class FooTempl {
7
8
9     def someHTML(String content) '''<html><body>«content»</body></html>'''

                <h1>«p.name»</h1>
            «ENDIF»
            «FOR q : p.questions»
                <p>
                    <h2>«q.text»</h2>
                    <ul>
                        «FOR o : q.options»
                            <li>«o.text»</li>
                        «ENDFOR»
                    </ul>
                </p>
            «ENDFOR»
        «ENDFOR»
    </body>
</html>
...

```

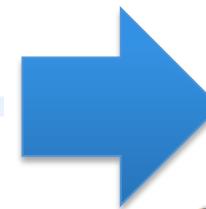

Templates (2)

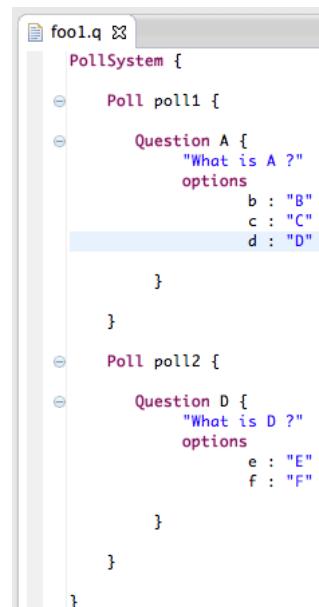

poll1

What is A ?

- B
- C
- D

poll2

What is D ?

- E
- F

Templates (3)

- You already experiment with web templating engines (JSP, Scala templates in Play!, Symfony templates, etc.)

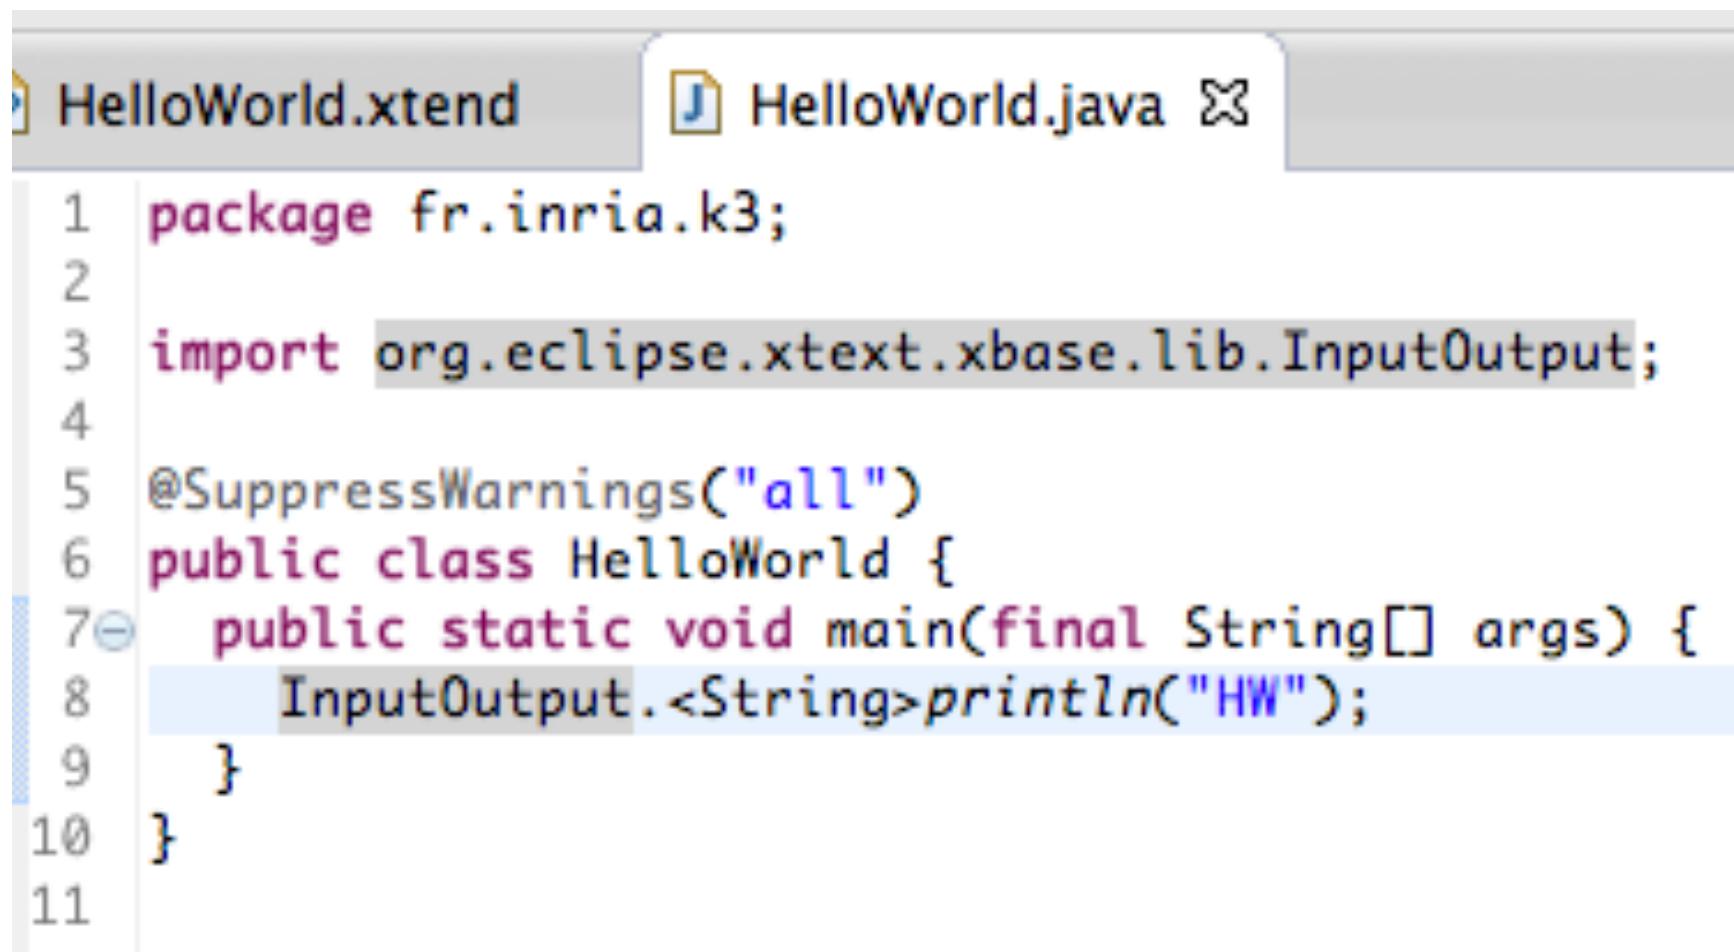

```
<h1>Exemple de page JSP</h1>
<%-- Impression de variables --%>
<p>Au moment de l'exécution de ce script, nous sommes le <%= date %>. </p>
<p>Cette page a été affichée <%= nombreVisites %> fois !</p>
</body>
</html>
```

- Alternatives exist in the modeling world
 - Multiple pre-defined and customizables generators

- Xtend: seamless integration into a general purpose language

Xtend to Java

The screenshot shows an IDE interface with two tabs: "HelloWorld.xtend" and "HelloWorld.java". The "HelloWorld.java" tab is currently selected, displaying the following Java code:

```
1 package fr.inria.k3;
2
3 import org.eclipse.xtext.xbase.lib.InputOutput;
4
5 @SuppressWarnings("all")
6 public class HelloWorld {
7     public static void main(final String[] args) {
8         InputOutput.<String>println("HW");
9     }
10 }
```

Xtend to Java (2)

more after

The image shows a screenshot of an IDE interface. At the top, there are two tabs: 'HelloWorld.xtend' and 'HelloWorld.java'. The 'HelloWorld.xtend' tab is currently selected. Below the tabs, the code for 'HelloWorld.xtend' is displayed:

```
1 package fr.inria.k3;
2
3 import org.eclipse.xtext.xbase.lib.InputOutput;
4
5 @SuppressWarnings("all")
6 public class HelloWorld {
7     public static void main(final String[] args) {
8         InputOutput.<String>println("HW");
9     }
10}
```

A large black curved arrow originates from the line 'InputOutput.<String>println("HW");' in the Xtend code and points down to the corresponding Java code in the 'HelloWorld.java' tab.

The 'HelloWorld.java' tab is also visible, showing the generated Java code:

```
package org.eclipse.xtext.xbase.lib;

import com.google.common.annotations.GwtCompatible;

/**
 * Utilities to print information to the console.
 *
 * @author Sven Efftinge - Initial contribution and API
 */
@GwtCompatible public class InputOutput {

    /**
     * Prints a newline to standard out, by delegating directly to <code>System.out.println()</code>
     * @since 2.3
     */
    public static void println() {
        System.out.println();
    }

    /**
     * Prints the given {@code object} to {@link System#out System.out} and terminate the line. Useful to log partial
     * expressions to trap errors, e.g. the following is possible: <code>println(1 + println(2)) + 3</code>
     *
     * @param object
     *          the to-be-printed object
     * @return the printed object.
     */
    public static <T> T println(T object) {
        System.out.println(object);
        return object;
    }
}
```

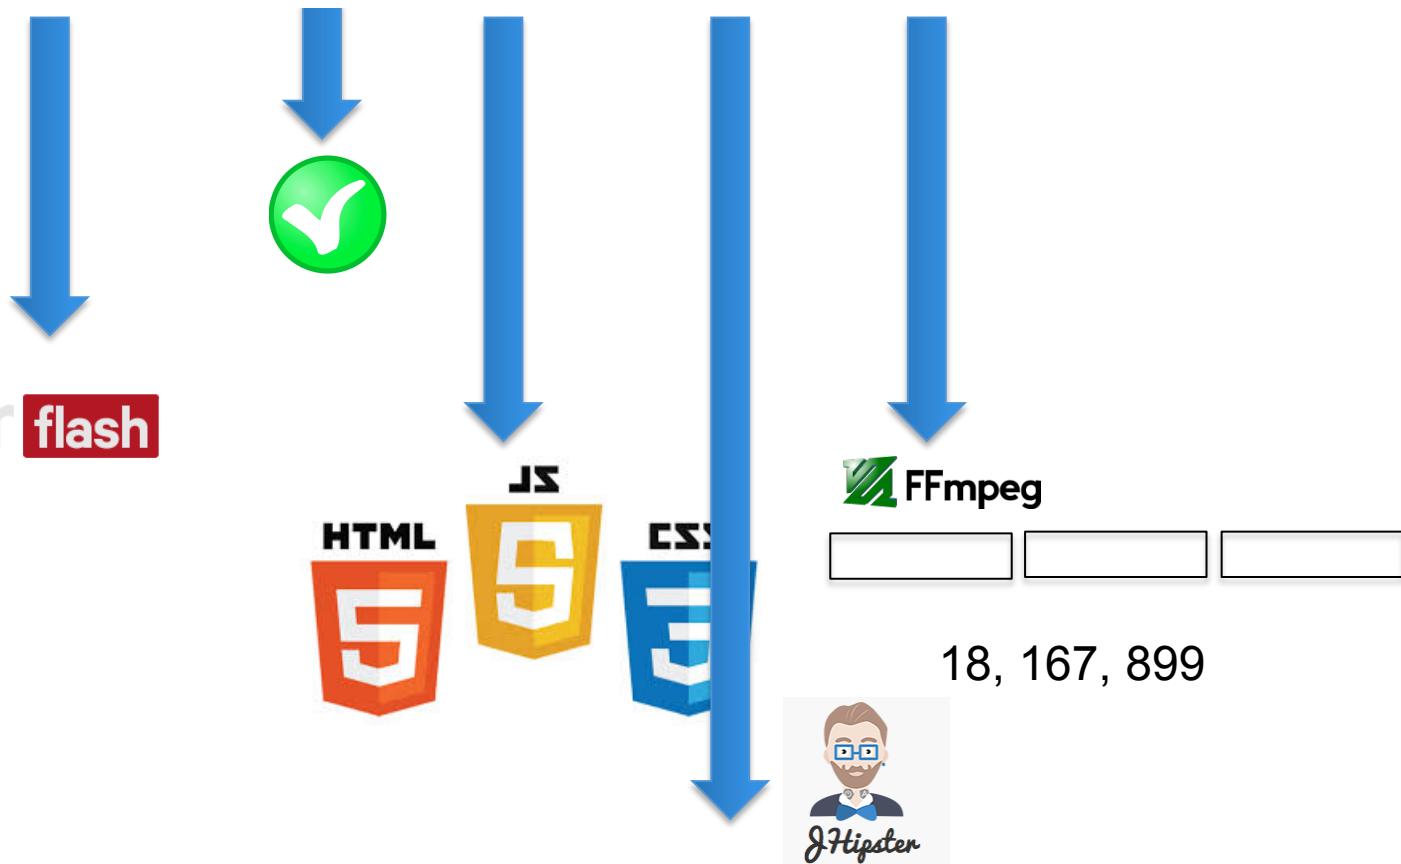

Xtend/Xtext

Back to our scenarios

foo1.videoogen

```
mandatory videooseq v1 "https://www.youtube.com/watch?v=PJNi1uYhV5w"

}

public class MyClassTest {

    @BeforeClass
    public static void testSetup() {
    }

    @AfterClass
    public static void testCleanup() {
        // Teardown for data used by the unit tests
    }

    @Test(expected = IllegalArgumentException.class)
    public void testExceptionIsThrown() {
        MyClass tester = new MyClass();
        tester.multiply(1000, 5);
    }

    @Test
    public void testMultiply() {
        MyClass tester = new MyClass();
        assertEquals("10 x 5 must be 50", 50, tester.multiply(10, 5));
    }
}
```

Annotations (JUnit 4)

@Test public void method()	The <code>@Test</code> annotation identifies a method as a test method.
<code>@Test(expected = Exception.class)</code>	Fails, if the method does not throw the named exception.
<code>@Test(timeout=100)</code>	Fails, if the method takes longer than 100 milliseconds.
<code>@Before public void method()</code>	This method is executed before each test. It is used to can prepare the test environment (e.g. read input data, initialize the class).
<code>@After public void method()</code>	This method is executed after each test. It is used to cleanup the test environment (e.g. delete temporary data, restore defaults). It can also save memory by cleaning up expensive memory structures.
<code>@BeforeClass public static void method()</code>	This method is executed once, before the start of all tests. It is used to perform time intensive activities, for example to connect to a database. Methods annotated with this annotation need to be defined as <code>static</code> to work with JUnit.
<code>@AfterClass public static void method()</code>	This method is executed once, after all tests have been finished. It is used to perform clean-up activities, for example to disconnect from a database. Methods annotated with this annotation need to be defined as <code>static</code> to work with JUnit.

http://www.vogella.com/articles/JUnit/article.html#usingjunit_annotations

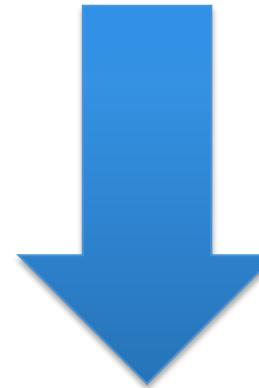

```
@XmlRootElement  
public class Customer {  
  
    String name;  
    int age;  
    int id;  
  
    public String getName() {  
        return name;  
    }  
  
    @XmlElement  
    public void setName(String name) {  
        this.name = name;  
    }  
  
    public int getAge() {  
        return age;  
    }  
  
    @XmlElement  
    public void setAge(int age) {  
        this.age = age;  
    }  
  
    public int getId() {  
        return id;  
    }  
  
    @XmlAttribute  
    public void setId(int id) {  
        this.id = id;  
    }  
}
```

JAXB

Java Annotations

```
Customer customer = new Customer();  
customer.setId(100);  
customer.setName("mkyong");  
customer.setAge(29);
```

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>  
<customer id="100">  
    <age>29</age>  
    <name>mkyong</name>  
</customer>
```

HIBERNATE

2.2.1. Marking a POJO as persistent entity

Every persistent POJO class is an entity and is declared using the `@Entity` annotation (at the class level):

```
@Entity
public class Flight implements Serializable {
    Long id;

    @Id
    public Long getId() { return id; }

    public void setId(Long id) { this.id = id; }
}
```

`@Entity` declares the class as an entity (i.e. a persistent POJO class), `@Id` declares the identifier property of this entity. The other mapping declarations are implicit. The class `Flight` is mapped to the `Flight` table, using the column `id` as its primary key column.

```
@Entity
class MedicalHistory implements Serializable {
    @Id @OneToOne
    @JoinColumn(name = "person_id")
    Person patient;
}

@Entity
public class Person implements Serializable {
    @Id @GeneratedValue Integer id;
}
```

Javadoc (old fashion, not real annotations)

```
/**  
 * Returns an Image object that can then be painted on the screen.  
 * The url argument must specify an absolute {@link URL}. The name  
 * argument is a specifier that is relative to the url argument.  
 * <p>  
 * This method always returns immediately, whether or not the  
 * image exists. When this applet attempts to draw the image on  
 * the screen, the data will be loaded. The graphics primitives  
 * that draw the image will incrementally paint on the screen.  
 *  
 * @param url an absolute URL giving the base location of the image  
 * @param name the location of the image, relative to the url argument  
 * @return the image at the specified URL  
 * @see Image  
 */  
public Image getImage(URL url, String name) {  
    try {  
        return getImage(new URL(url, name));  
    } catch (MalformedURLException e) {  
        return null;  
    }  
}
```

The Google Annotations Gallery is an exciting new Java open source library that provides a rich set of annotations for developers to express themselves.

Do you find the standard Java annotations dry and lackluster? Have you ever resorted to leaving messages to fellow developers with the `@Deprecated` annotation? Wouldn't you rather leave a `@LOL` or `@Facepalm` instead?

Not only can you leave expressive remarks in your code, you can use these annotations to draw attention to your poetic endeavors. How many times have you written a palindromic or synecdochal line of code and wished you could annotate it for future readers to admire? Look no further than `@Palindrome` and `@Synecdoche`.

But wait, there's more. The Google Annotations Gallery comes complete with dynamic bytecode instrumentation. By using the `gag-agent.jar` Java agent, you can have your annotations behavior-enforced at runtime. For example, if you want to ensure that a method parameter is non-zero, try `@ThisHadBetterNotBe(Property.ZERO)`. Want to completely inhibit a method's implementation? Try `@Noop`.

Annotations for...

- Documentation
 - Javadoc like
- Information to the Compiler
 - Suppress warnings, error detections
- Generation
 - Code (Java, SQL, etc.)
 - Configuration files (e.g., XML-like)
- Runtime processing

⇒ Transformation of programs, datas, models

⇒ You can define your own

Annotations: How does it work?

The screenshot shows a browser window displaying the Javadoc for the `org.junit.Test` class. The URL in the address bar is `junit.sourceforge.net/javadoc/org/junit/Test.html`. The page has a green header bar with links for Overview, Package, Class, Tree, Deprecated, Index, and Help. Below the header, there are links for PREV CLASS and NEXT CLASS. A summary section includes links for REQUIRED and OPTIONAL. The main content area is titled "Annotation Type Test" and contains the Java code for the annotation.

```
@Retention(value=RUNTIME)
@Target(value=METHOD)
public @interface Test
```

org.junit

Annotation Type Test

```
@Retention(value=RUNTIME)
@Target(value=METHOD)
public @interface Test
```

The `Test` annotation tells JUnit that the `public void` method to which it is applied has no side effects. If no exceptions are thrown, the test is assumed to have succeeded.

A simple test looks like this:

```
public class Example {
    @Test
    public void method() {
        org.junit.Assert.assertTrue( new ArrayList().isEmpty() );
    }
}
```

The `Test` annotation supports two optional parameters. The first, `expected`,

```
@Test(expected=IndexOutOfBoundsException.class) public
    new ArrayList<Object>().get(1);
}
```

The second optional parameter, `timeout`, causes a test to fail if it takes longer than

```
@Test(timeout=100) public void infinity() {
    while(true);
}
```

Annotations: How does it work?

GitHub, Inc. [US] <https://github.com/junit-team/junit/blob/master/src/main/java/org/junit/Test.java>

```
60  @Retention(RetentionPolicy.RUNTIME)
61  @Target({ElementType.METHOD})

Transformation of Java code

Annotations and Transformations (Java 5, old way)

← → C docs.oracle.com/javase/1.5.0/docs/guide/apt/GettingStarted.html

Getting Started with
the Annotation Processing Tool (**apt**)

What is **apt**?

The command-line utility **apt**, annotation processing tool, finds and executes *annotation processors* based on the annotations present in the set of specified source files being examined. The annotation

Annotations and Transformations (Java 5, old way)

Annotation Processors

```
/*
 * This class is used to run an annotation processor that lists class
 * names. The functionality of the processor is analogous to the
 * ListClass doclet in the Doclet Overview.
 */
public class ListClassApf implements AnnotationProcessorFactory {
    // Process any set of annotations
    private static final Collection<String> supportedAnnotations
        = unmodifiableCollection(Arrays.asList("*"));

    // No supported options
    private static final Collection<String> supportedOptions = emptySet();

    public Collection<String> supportedAnnotationTypes() {
        return supportedAnnotations;
    }

    public Collection<String> supportedOptions() {
        return supportedOptions;
    }

    public AnnotationProcessor getProcessorFor(
        Set<AnnotationTypeDeclaration> atds,
        AnnotationProcessorEnvironment env) {
        return new ListClassAp(env);
    }

    private static class ListClassAp implements AnnotationProcessor {
        private final AnnotationProcessorEnvironment env;
        ListClassAp(AnnotationProcessorEnvironment env) {
            this.env = env;
        }

        public void process() {
            for (TypeDeclaration typeDecl : env.getSpecifiedTypeDeclarations())
                typeDecl.accept(getDeclarationScanner(new ListClassVisitor(),
                    NO_OP));
        }

        private static class ListClassVisitor extends SimpleDeclarationVisitor {
            public void visitClassDeclaration(ClassDeclaration d) {
                System.out.println(d.getQualifiedName());
            }
        }
    }
}
```

The logo for the apt tool, consisting of the lowercase letters "apt" in a bold, sans-serif font, enclosed within a thin black rectangular border.

The `apt` Command Line

In addition to its own options, the `apt` tool accepts all of the command-line options accepted by `javac`.

The `apt` specific options are:

- s *dir*
Specify the directory root under which processor-generated source files will be placed.
- nocompile
Do not compile source files to class files.
- print
Print out textual representation of specified types; perform no annotation processing.
- A[key[=val]]
Options to pass to annotation processors -- these are not interpreted by `apt` directly.
- factorypath *path*
Specify where to find annotation processor factories; if this option is used, the classpath is ignored.
- factory *classname*
Name of `AnnotationProcessorFactory` to use; bypasses default discovery procedure.

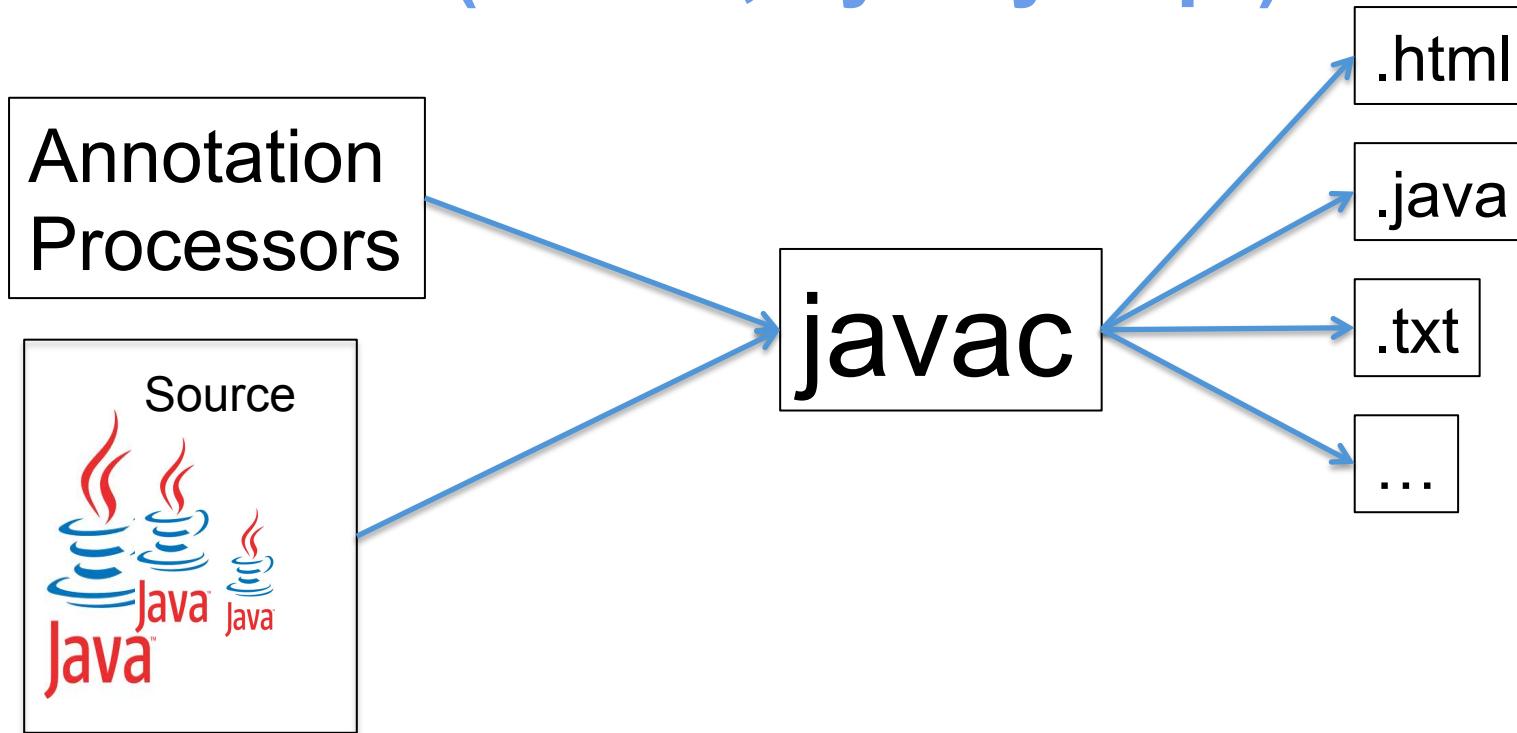

How `apt` shares some of `javac`'s options:

- d *dir*
Specify where to place processor and javac generated class files.
- cp *path* or -classpath *path*
Specify where to find user class files and annotation processor factories. If `-factorypath` is specified, it takes precedence over the classpath.

There are a few `apt` hidden options that may be useful for debugging:

- XListAnnotationTypes
List found annotation types.
- XListDeclarations
List specified and included declarations.
- XPrintAptRounds
Print information about initial and recursive `apt` rounds.
- XPrintFactoryInfo
Print information about which annotations a factory is asked to process.

Annotations and Transformations (Java 6, bye bye apt)

Integrated into the Java compiler (javac)
New API: Pluggable Annotation Processing

Annotations and Transformations (Java 6, bye bye apt)

Annotation

Prc

```
import java.util.*;
import javax.annotation.processing.*;
import javax.lang.model.*;
import javax.lang.model.element.*;
```

```
@SupportedAnnotationTypes(value= {"*"})
@SupportedSourceVersion(SourceVersion.RELEASE_6)

public class TestAnnotationProcessor extends AbstractProcessor {

    @Override
    public boolean process(
        Set<?> extends TypeElement> annotations, RoundEnvironment roundEnv){

        for (TypeElement element : annotations){
            System.out.println(element.getQualifiedName());
        }
        return true;
    }
}
```

              dateAssignment = "12-11-2007")
        public void methode2() {
        }
}
```

You can define your own annotations

- Specification
 - At the Class, Field, Method level
 - Annotations can be combined
 - Annotations can have parameters
- Transformation (compilation)
 - Introspection
 - Compiler (javac/apt) and definition of « processors »
- Widely used
 - Generation, verification, etc.

Back to Xtend

- Active Annotations
 - Facilities to specify Annotations and their treatment (API)
 - Seamless integration in the IDE
 - On-the-fly compilation to Java allows proper type checking and auto-completion

Example

```
package fr.inria.k3

@Singleton
class GUIWindow {

    int x ;
    int y ;

}
```

Example

```
package fr.inria.k3
```

```
@Singleton
```

```
class GUIWindow {
```

```
    int x ;  
    int y ;
```

```
    public final class GUIWindow {  
        private GUIWindow() {  
            // singleton  
        }  
  
        private int x;  
  
        private int y;  
  
        private final static GUIWindow INSTANCE = new GUIWindow();  
  
        public static GUIWindow getINSTANCE() {  
            return INSTANCE;  
        }  
    }
```

```
package fr.inria.k3
```

```
@Singleton
```

```
class GUIWindow {
```

```
    int x;
```

```
    int y;
```

```
}
```

```
public final class GUIWindow {
    private GUIWindow() {
        // singleton
    }

    private int x;
    private int y;

    private final static GUIWindow INSTANCE = new GUIWindow();
    public static GUIWindow getINSTANCE() {
        return INSTANCE;
    }
}
```

```
class SingletonProcessor extends AbstractClassProcessor {

    override doTransform(MutableClassDeclaration annotatedClass, extension TransformationContext context) {

        annotatedClass.final = true

        if (annotatedClass.declaredConstructors.size > 1)
            annotatedClass.addError("More than one constructor is defined")

        val constructor = annotatedClass.declaredConstructors.head
        if (constructor.parameters.size > 0)
            constructor.addError("Constructor has arguments")

        if (constructor.body == null) {

            // no constructor defined in the annotated class
            constructor.visibility = Visibility::PRIVATE
            constructor.body = ["'// singleton'"]
        } else {
            if (constructor.visibility != Visibility::PRIVATE)
                constructor.addError("Constructor is not private")
        }

        annotatedClass.addField('INSTANCE') [
            visibility = Visibility::PRIVATE
            static = true
            final = true
            type = annotatedClass.newTypeReference
            initializer = [
                "'new «annotatedClass.simpleName»()'"
            ]
        ]

        annotatedClass.addMethod('getINSTANCE') [
            visibility = Visibility::PUBLIC
            static = true
            returnType = annotatedClass.newTypeReference
            body = [
                "'return INSTANCE;'"
            ]
        ]
    }
}
```

Example (2)

```
package fr.inria.k3

@Extract
class ExtractA {
```

```
package fr.inria.k3;

import fr.inria.k3.Extract;.

@Extract
@SuppressWarnings("all")
public class ExtractA implements ExtractAInterface {
```

```
package fr.inria.k3
```

```
@Extract  
class ExtractA {  
}
```

```
package fr.inria.k3;
```

```
import fr.inria.k3.Extract;
```

```
@Extract  
@SuppressWarnings("all")  
public class ExtractA implements ExtractAInterface {  
}
```

```
/**  
 * Extracts an interface for all locally declared public methods.  
 */  
@Target(ElementType.TYPE)  
@Active(ExtractProcessor)  
annotation Extract {}  
  
class ExtractProcessor extends AbstractClassProcessor {  
  
    override doRegisterGlobals(ClassDeclaration annotatedClass, RegisterGlobalsContext context) {  
        context.registerInterface(annotatedClass.interfaceName)  
    }  
  
    def getInterfaceName(ClassDeclaration annotatedClass) {  
        annotatedClass.qualifiedName+"Interface"  
    }  
  
    override doTransform(MutableClassDeclaration annotatedClass, extension TransformationContext context) {  
        val interfaceType = findInterface(annotatedClass.interfaceName)  
  
        // add the interface to the list of implemented interfaces  
        annotatedClass.implementedInterfaces = annotatedClass.implementedInterfaces + #[interfaceType.newTypeReference]  
  
        // add the public methods to the interface  
        for (method : annotatedClass.declaredMethods) {  
            if (method.visibility == Visibility.PUBLIC) {  
                interfaceType.addMethod(method.simpleName) [  
                    docComment = method.docComment  
                    returnType = method.returnType  
                    for (p : method.parameters) {  
                        addParameter(p.simpleName, p.type)  
                    }  
                    exceptions = method.exceptions  
                ]  
            }  
        }  
    }  
}
```

Predefined Annotations

```
@Singleton  
class SingletonA {  
  
    @Property  
    int a = 13 ;  
  
    @Property  
    int b ;  
  
    @Property  
    String c ;  
  
}
```

```
@Singleton  
@SuppressWarnings("all")  
public final class SingletonA {  
    private SingletonA() {  
        // singleton  
    }  
  
    private int _a = 13;  
  
    public int getA() {  
        return this._a;  
    }  
  
    public void setA(final int a) {  
        this._a = a;  
    }  
  
    private int _b;  
  
    public int getB() {  
        return this._b;  
    }  
  
    public void setB(final int b) {  
        this._b = b;  
    }  
  
    private String _c;  
  
    public String getC() {  
        return this._c;  
    }  
  
    public void setC(final String c) {  
        this._c = c;  
    }  
  
    private final static SingletonA INSTANCE = new SingletonA();  
  
    public static SingletonA getINSTANCE() {  
        return INSTANCE;  
    }  
}
```

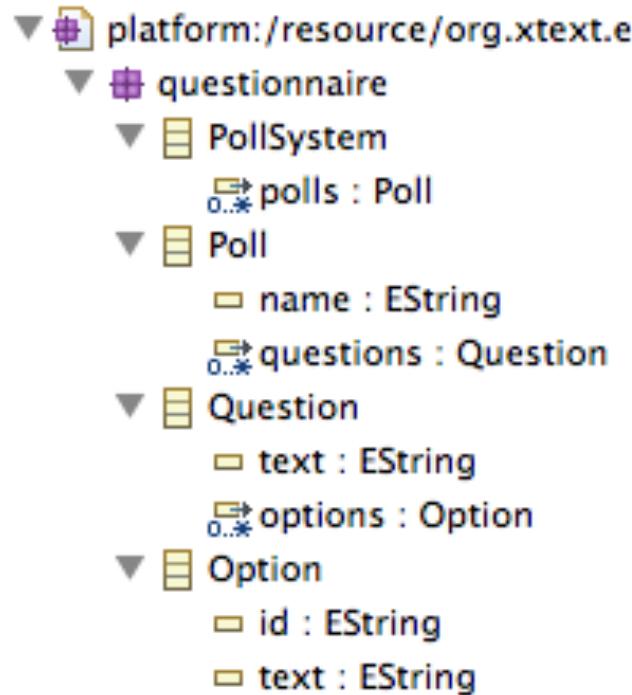

Visitors, EMF, and Xtend

(key to M2M or M2T:
iterate
over the model)

```

PollSystem {
    Poll Quality {
        Question q1 {
            "Value the user experience"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
        Question q2 {
            "Value the layout"
            options {
                A : "It was not easy to locate elements"
                B : "I didn't realize"
                C : "It was easy to locate elements"
            }
        }
    }
    Poll Performance {
        Question q1 {
            "Value the time response"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
    }
}

```

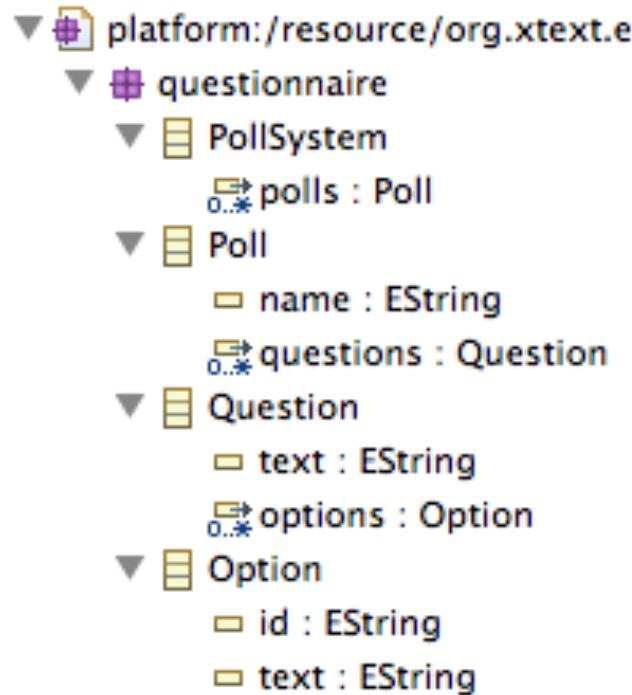

We already give examples of transformation, defined over the metamodel...

Common point: the need to visit the model (graph)

```

PollSystem {
    Poll Quality {
        Question q1 {
            "Value the user experience"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
        Question q2 {
            "Value the layout"
            options {
                A : "It was not easy to locate elements"
                B : "I didn't realize"
                C : "It was easy to locate elements"
            }
        }
    }
    Poll Performance {
        Question q1 {
            "Value the time response"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
    }
}

```

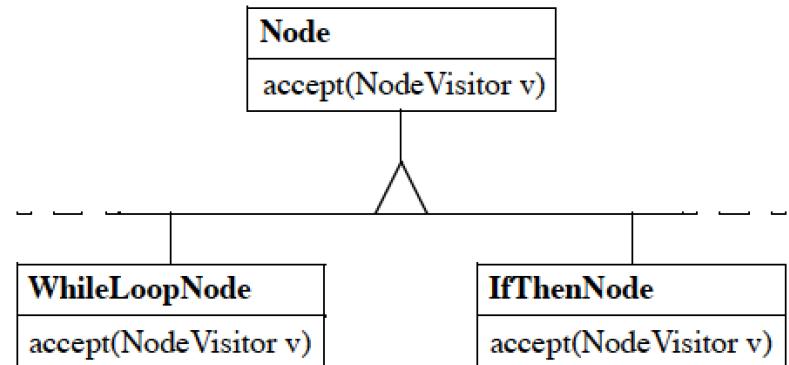

Visit the model (graph)

Possible solution: a series of casts (lots of if-statements and traversal loops)

Visitor Pattern

separating an algorithm from an object structure on which it operates

```
public class WhileLoopNode extends Node {  
    protected Node condition, body;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitWhileLoop(this);  
    }  
}  
  
public class IfThenNode extends Node {  
    protected Node condition, thenBranch;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitIfThen(this);  
    }  
}
```

```
public abstract class NodeVisitor {  
    /* ... */  
    public abstract void visitWhileLoop(WhileLoopNode n);  
    public abstract void visitIfThen(IfThenNode n);  
}  
  
public class TypeCheckingVisitor extends NodeVisitor {  
    /* ... */  
    public void visitWhileLoop(WhileLoopNode n) { n.getCondition().accept(this); /* ... */ }  
    public void visitIfThen(IfThenNode n) { /* ... */ }  
}
```

new operations can be added modularly, without needing to edit any of the **Node** subclasses: the programmer simply defines a new **NodeVisitor** subclass containing methods for visiting each class in the **Node** hierarchy.

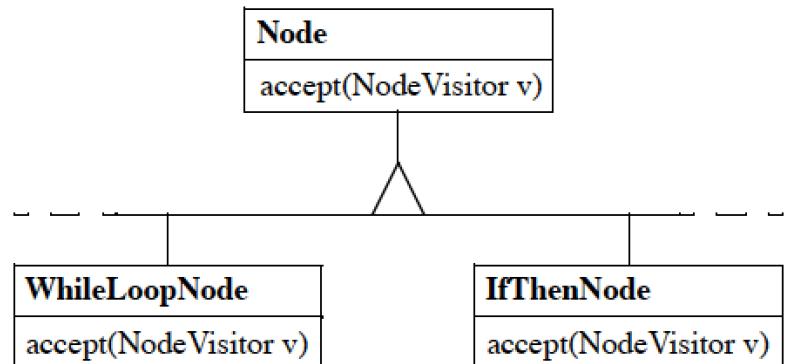

Visitor Pattern (problems)

```
public class WhileLoopNode extends Node {  
    protected Node condition, body;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitWhileLoop(this);  
    }  
}
```

```
public class IfThenNode extends Node {  
    protected Node condition, thenBranch;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitIfThen(this);  
    }  
}
```

```
public abstract class NodeVisitor {  
    /* ... */  
    public abstract void visitWhileLoop(WhileLoopNode n);  
    public abstract void visitIfThen(IfThenNode n);  
}
```

```
public class TypeCheckingVisitor extends NodeVisitor {  
    /* ... */  
    public void visitWhileLoop(WhileLoopNode n) { n.getCondition().accept(this); /* ... */ }  
    public void visitIfThen(IfThenNode n) { /* ... */ }  
}
```

#1 stylized double-dispatching code is tedious to write and prone to error.

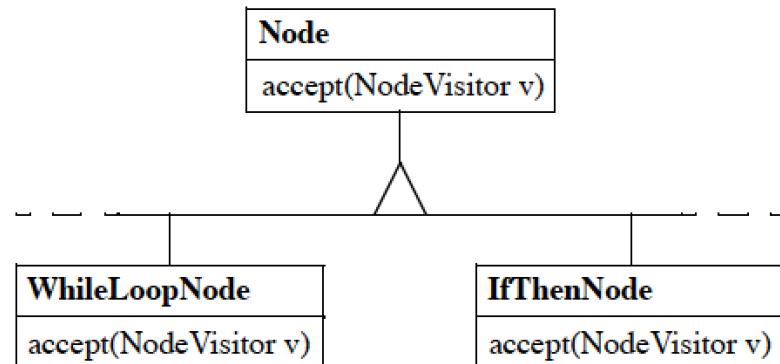

Visitor Pattern (problems)

```
public class WhileLoopNode extends Node {  
    protected Node condition, body;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitWhileLoop(this);  
    }  
}
```

```
public class IfThenNode extends Node {  
    protected Node condition, thenBranch;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitIfThen(this);  
    }  
}
```

```
public abstract class NodeVisitor {  
    /* ... */  
    public abstract void visitWhileLoop(WhileLoopNode n);  
    public abstract void visitIfThen(IfThenNode n);  
}
```

```
public class TypeCheckingVisitor extends NodeVisitor {  
    /* ... */  
    public void visitWhileLoop(WhileLoopNode n) { n.getCondition().accept(this); /* ... */ }  
    public void visitIfThen(IfThenNode n) { /* ... */ }  
}
```

#2 the need for the Visitor pattern must be anticipated ahead of time, when the Node class is first implemented

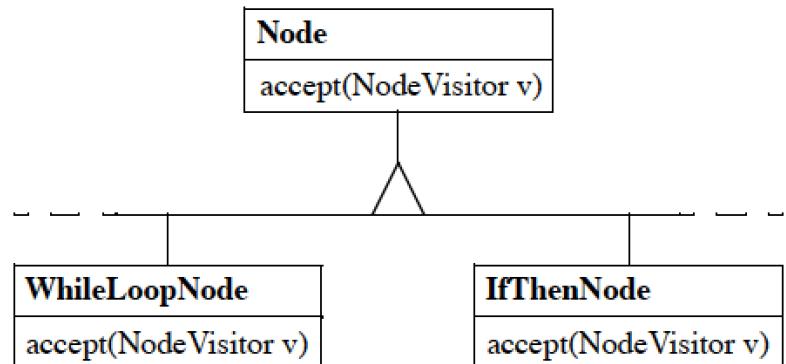

Visitor Pattern (problems)

```
public class WhileLoopNode extends Node {  
    protected Node condition, body;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitWhileLoop(this);  
    }  
}
```

```
public class IfThenNode extends Node {  
    protected Node condition, thenBranch;  
    /* ... */  
    public void accept(NodeVisitor v) {  
        v.visitIfThen(this);  
    }  
}
```

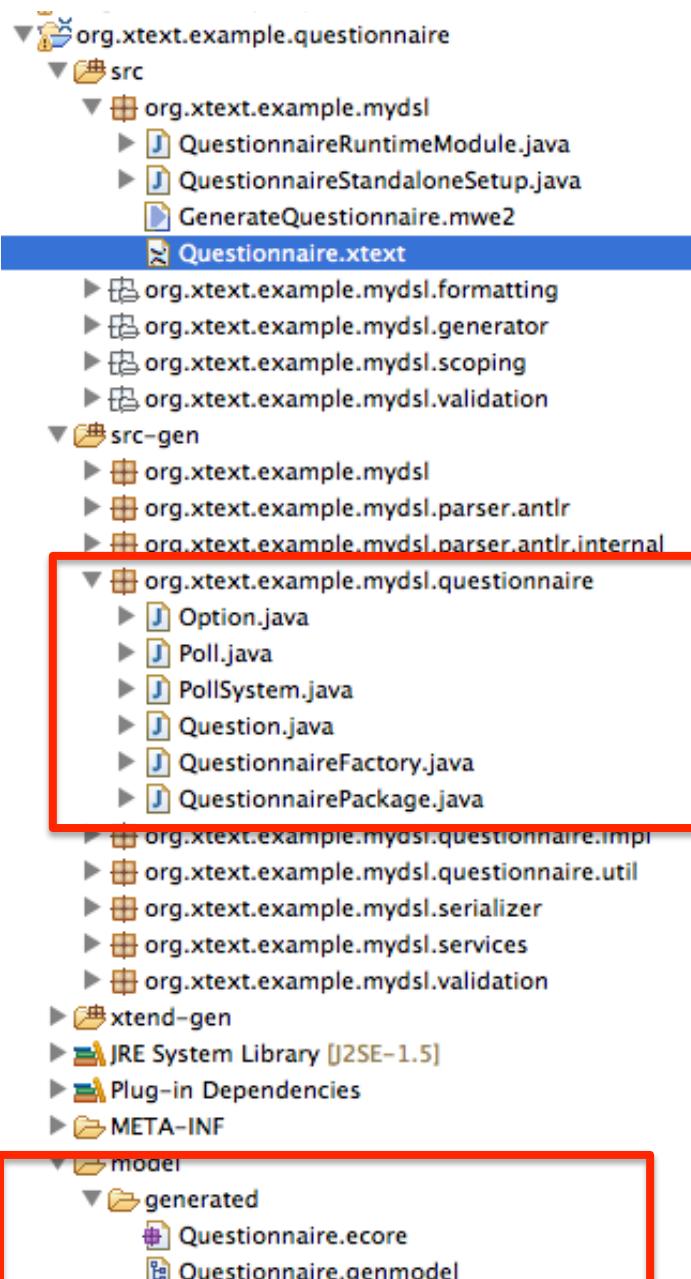

```
public abstract class NodeVisitor {  
    /* ... */  
    public abstract void visitWhileLoop(WhileLoopNode n);  
    public abstract void visitIfThen(IfThenNode n);  
}
```

```
public class TypeCheckingVisitor extends NodeVisitor {  
    /* ... */  
    public void visitWhileLoop(WhileLoopNode n) { n.getCondition().accept(this); /* ... */ }  
    public void visitIfThen(IfThenNode n) { /* ... */ }  
}
```

#3 class hierarchy evolution (e.g., new **Node** subclass) forces us to rewrite **NodeVisitor**

Visitor Pattern (impact of the problem)

```
grammar org.xtext.example.mydsl.Questionnaire with org.eclipse.xtext.common.Terminals

generate questionnaire "http://www.xtext.org/example/mydsl/Questionnaire"

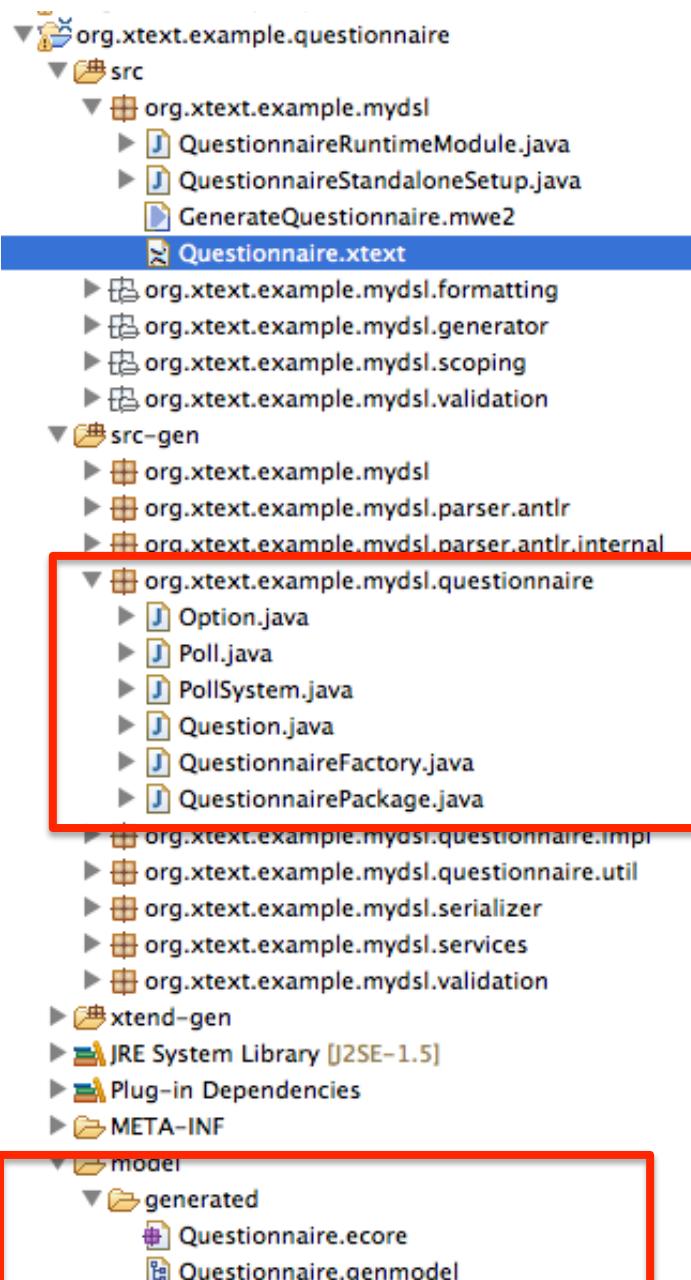

@PollSystem:
    'PollSystem' '{' polls+=Poll+ '}';

@Poll:
    'Poll' name=ID '{' questions+=Question+ '}';

Question : 'Question' ID? '{' text=STRING 'options'=options+=Option+ '}';

Option : id=ID ':' text=STRING ;
```

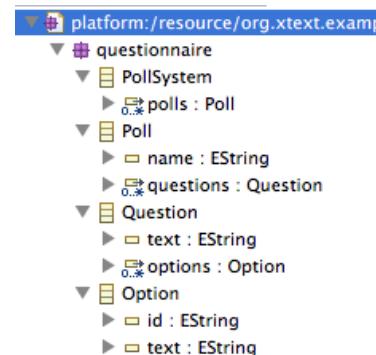

Visitor Pattern (impact of the problem)

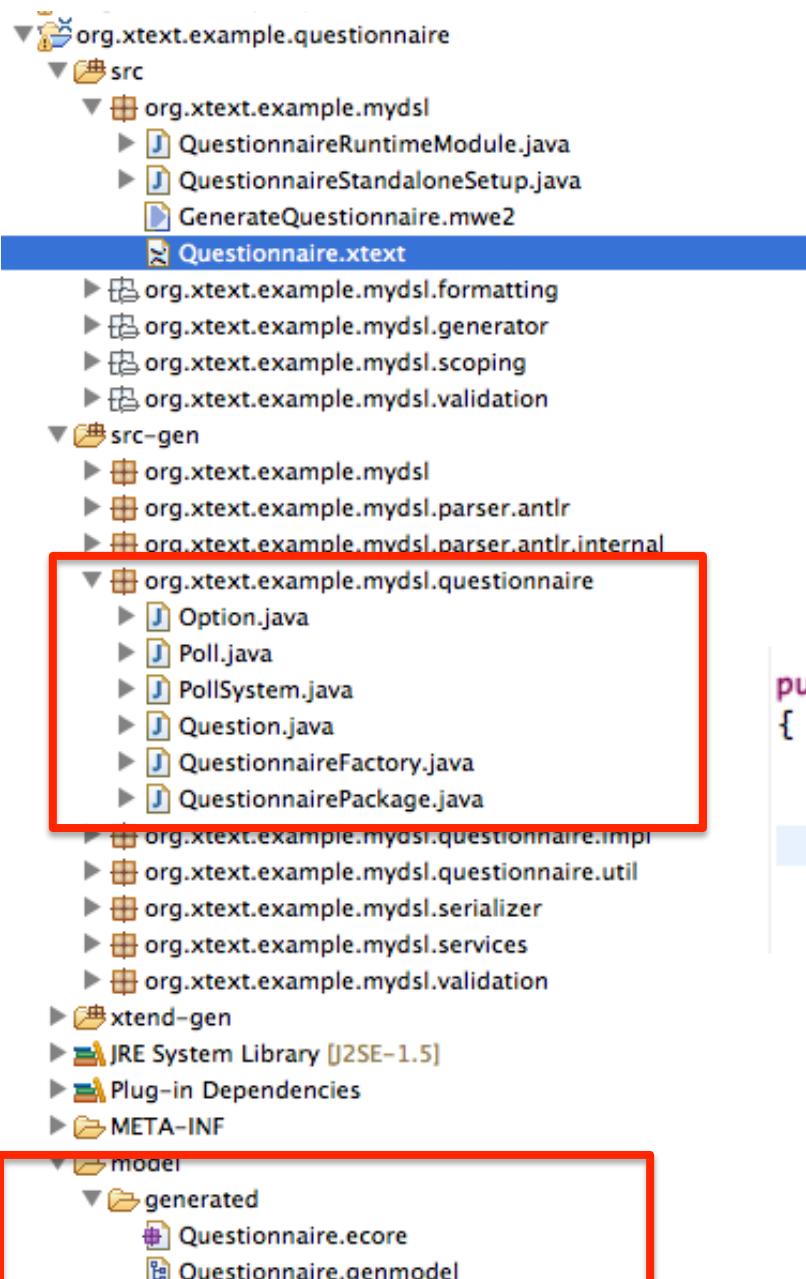

```
public interface Question extends EObject
{
    /**
     * Returns the value of the
     * <!-- begin-user-doc -->
     * <p>
     * If the meaning of the '<er
     * there really should be mo
     * </p>
     * <!-- end-user-doc -->
     * @return the value of the
     * @see #setText(String)
     * @see org.xtext.example.mydsl.questionnaire.QuestionnairePackage#getQuestion_Text()
     * @model
     * @generated
     */
    String getText();

    /**
     * Sets the value of the '{@link org.xtext.example.mydsl.questionnaire.Question#getText <em>Text</em>}' attribute.
     * <!-- begin-user-doc -->
     * <!-- end-user-doc -->
     * @param value the new value of the '<em>Text</em>' attribute.
     * @see #getText()
     * @generated
     */
    void setText(String value);
}
```

No accept method

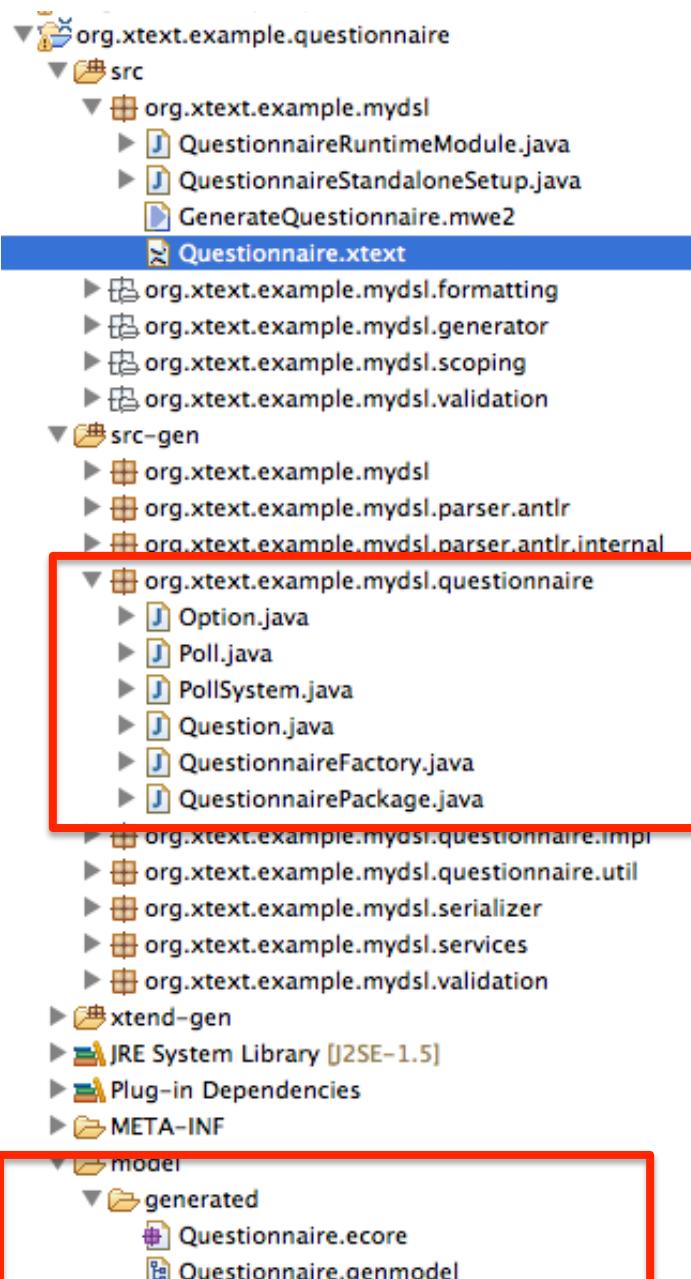

Visitor Pattern (impact of the problem)

Handcrafted code?

```
public interface Question extends EObject
{
    public void accept(QuestionnaireVisitor vis);
}
```

Visitor Pattern (impact of the problem)

⇒ Manual
⇒ Some classes are not concerned by the visit...

```
public interface Question extends EObject
{
    public void accept(QuestionnaireVisitor vis);
}
```

⇒ If Xtext Grammar changes,
you can restart again

Visitor Pattern (requirements)

#1 stylized double-dispatching code is tedious to write and prone to error.

Automation

#2 the need for the Visitor pattern must be anticipated ahead of time, when the Node class is first implemented

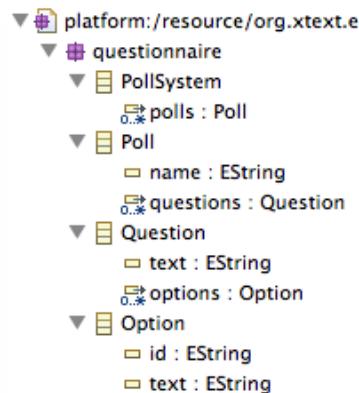

No accept method

Violation of open/close principle: no way

#3 class hierarchy evolution (e.g., new Node subclass) forces us to (completely) rewrite NodeVisitor

Automation

```
PollSystem {
    Poll Quality {
        Question q1 {
            "Value the user experience"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
        Question q2 {
            "Value the layout"
            options {
                A : "It was not easy to locate elements"
                B : "I didn't realize"
                C : "It was easy to locate elements"
            }
        }
    }
    Poll Performance {
        Question q1 {
            "Value the time response"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
    }
}
```

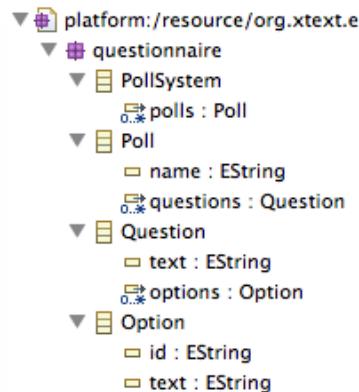

Possible solution (1):
« *Switch » generated
by... EMF

```
/**  
 * The switch that delegates to the <code>createXXX</code> methods.  
 * <!-- begin-user-doc -->  
 * <!-- end-user-doc -->  
 * @generated  
 */  
protected QuestionnaireSwitch<Adapter> modelSwitch =  
new QuestionnaireSwitch<Adapter>()  
{  
    @Override  
    public Adapter casePollSystem(PollSystem object)  
    {  
        return createPollSystemAdapter();  
    }  
    @Override  
    public Adapter casePoll(Poll object)  
    {  
        return createPollAdapter();  
    }  
    @Override

```
PollSystem {
    Poll Quality {
        Question q1 {
            "Value the user experience"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
        Question q2 {
            "Value the layout"
            options {
                A : "It was not easy to locate elements"
                B : "I didn't realize"
                C : "It was easy to locate elements"
            }
        }
    }
    Poll Performance {
        Question q1 {
            "Value the time response"
            options {
                A : "Bad"
                B : "Fair"
                C : "Good"
            }
        }
    }
}
```

```
def foo(PollSystem sys, Context c) {
    // treatment
}
```

```
pollSystem.foo (new Context)
```

Possible solution (2): Extension Methods of Xtend

Context (classical with the Visitor)

Can be seen as a way
to avoid a (very) long list of
parameters and record
the « state » of the visit

@Aspect

(Active Annotations
for implementing Visitors)

```
class A {  
  
    def boolean testReplacement() {  
        return false  
    }  
}
```

Weaving methods

AspectA can handle a context in a proper way

```
@Aspect(className=typeof(A))  
abstract class AspectA {  
  
    def String foo() {  
        return "A"  
    }  
  
    abstract def String foofoo()  
}
```

```
@Test  
def void testA() {  
    val l = new A  
    l.foofoo  
}
```

```

override def doTransform(List<? extends MutableClassDeclaration> classes, extension TransformationContext context) {

    //Method name_parameterLengths,
    val Map<MutableClassDeclaration, List<MutableClassDeclaration>> superclass = new HashMap<MutableClassDeclaration, List<MutableClassDeclaration>>()
    val Map<MutableMethodDeclaration, Set<MutableMethodDeclaration>> dispatchmethod = new HashMap<MutableMethodDeclaration, Set<MutableMethodDeclaration>>()
    init_superclass(classes, context, superclass)
    init_dispatchmethod(superclass, dispatchmethod, context)

    for (clazz : classes) {

        //var List<String> inheritList1 = new ArrayList<String>() //sortByClassInheritance(clazz)

        var List<MutableClassDeclaration> listRes = sortByClassInheritance(clazz, classes, context)
        val List<String> inheritList = new ArrayList<String>()
        listRes.forEach[c] inheritList.add(c.simpleName)
        listResMap.put(clazz, listRes)
        //sortByClassInheritance(clazz, inheritList1, context)

        /*val StringBuffer log = new StringBuffer
        log.append("before ")
        inheritList.forEach[ s | log.append(" " + s)]
        log.append("\n after ")
        inheritList1.forEach[ s | log.append(" " + s)]
        */
        //clazz.addError(log.toString)

        var classNam = clazz.annotations.findFirst[getValue('className') != null].getValue('className')
        //addError(clazz, classNam.class.toString)

        //var simpleNameF = classNam.eClass.ALLStructuralFeatures.findFirst[name == "simpleName"]
        //val className = classNam.eGet(simpleNameF) as String
        val className = classNam.class.getMethod("getSimpleClassName").invoke(classNam) as String
        //var identF = classNam.eClass.getALLStructuralFeatures().findFirst[name == "identifier"]
        //val identifier = classNam.eGet(identF) as String
        val identifier = classNam.class.getMethod("getIdentifier").invoke(classNam) as String
        val Map<MutableMethodDeclaration, String> bodies = new HashMap<MutableMethodDeclaration, String>()

        //clazz.addError(className)
        //MOVE non static fields
        fields_processing(context, clazz, className, identifier, bodies)

        //Transform method to static
        methods_processing(clazz, context, identifier, bodies, dispatchmethod, inheritList, className)

        aspectContextMaker(context, clazz, className, identifier)
    }
}

#1 Model Transformations

(importance, taxonomy, and
some techniques -- templates,
visitors, annotation processors)

#2 Xtend

(A general purpose language
with advanced features; an
illustration on how to transform
models in practice; Xtend
written in Xtext, using MDE
principles)

#3 All together

Grammar, Metamodel, models/
specifications, DSL/GPL, model
transformations, meta-
programming

For breathing life
into models!
